Step 1: Select the raw healthcare dataset

Observation: Selected the raw healthcare patient-admissions dataset in the file-selection window to begin the project.

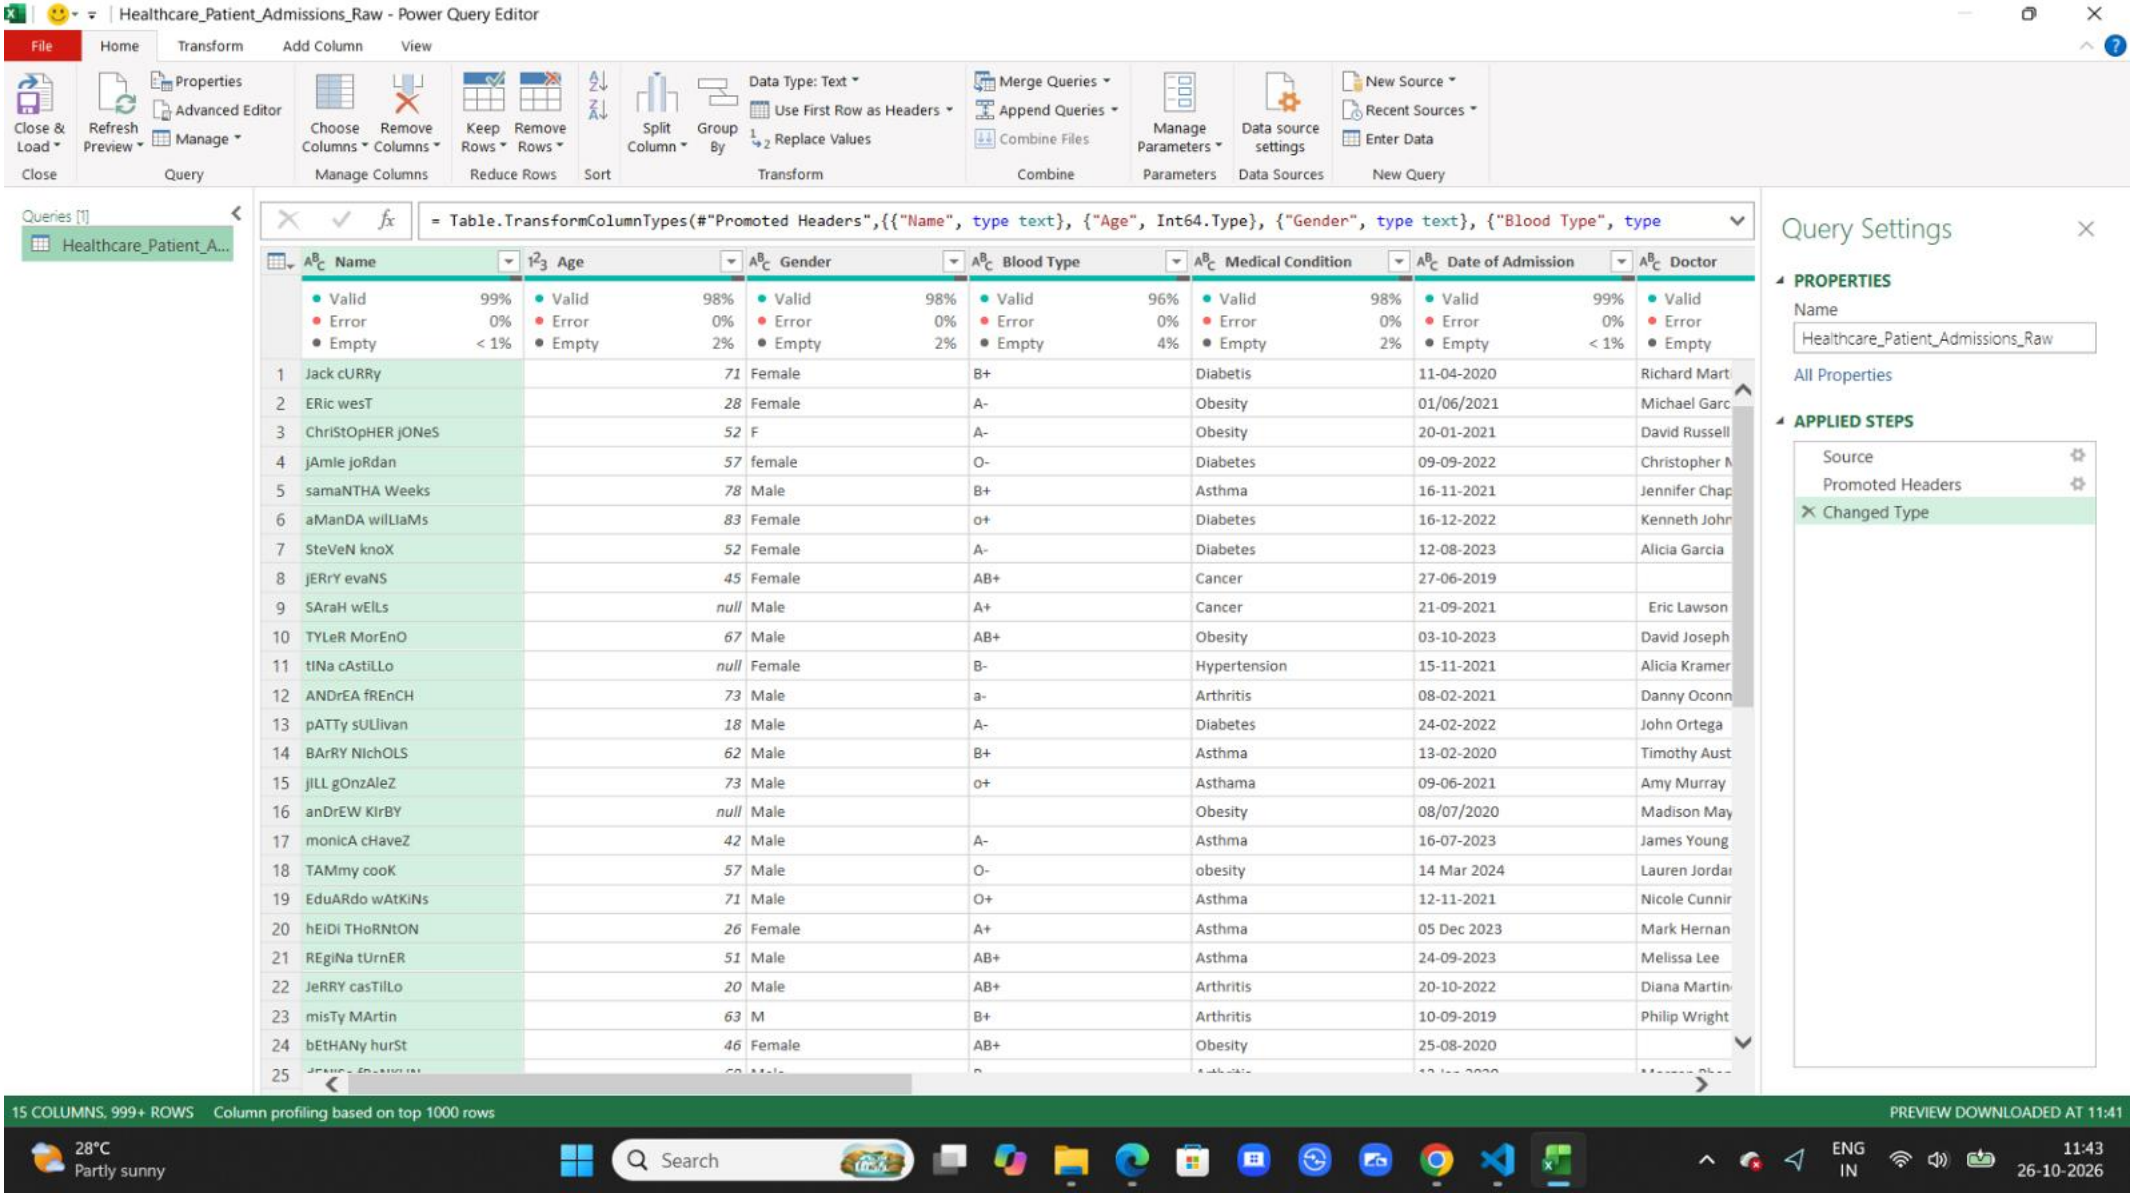

Step 2: Preview the raw dataset

Observation: Reviewed the dataset preview and checked that the patient-admission records and column headings appeared before importing.

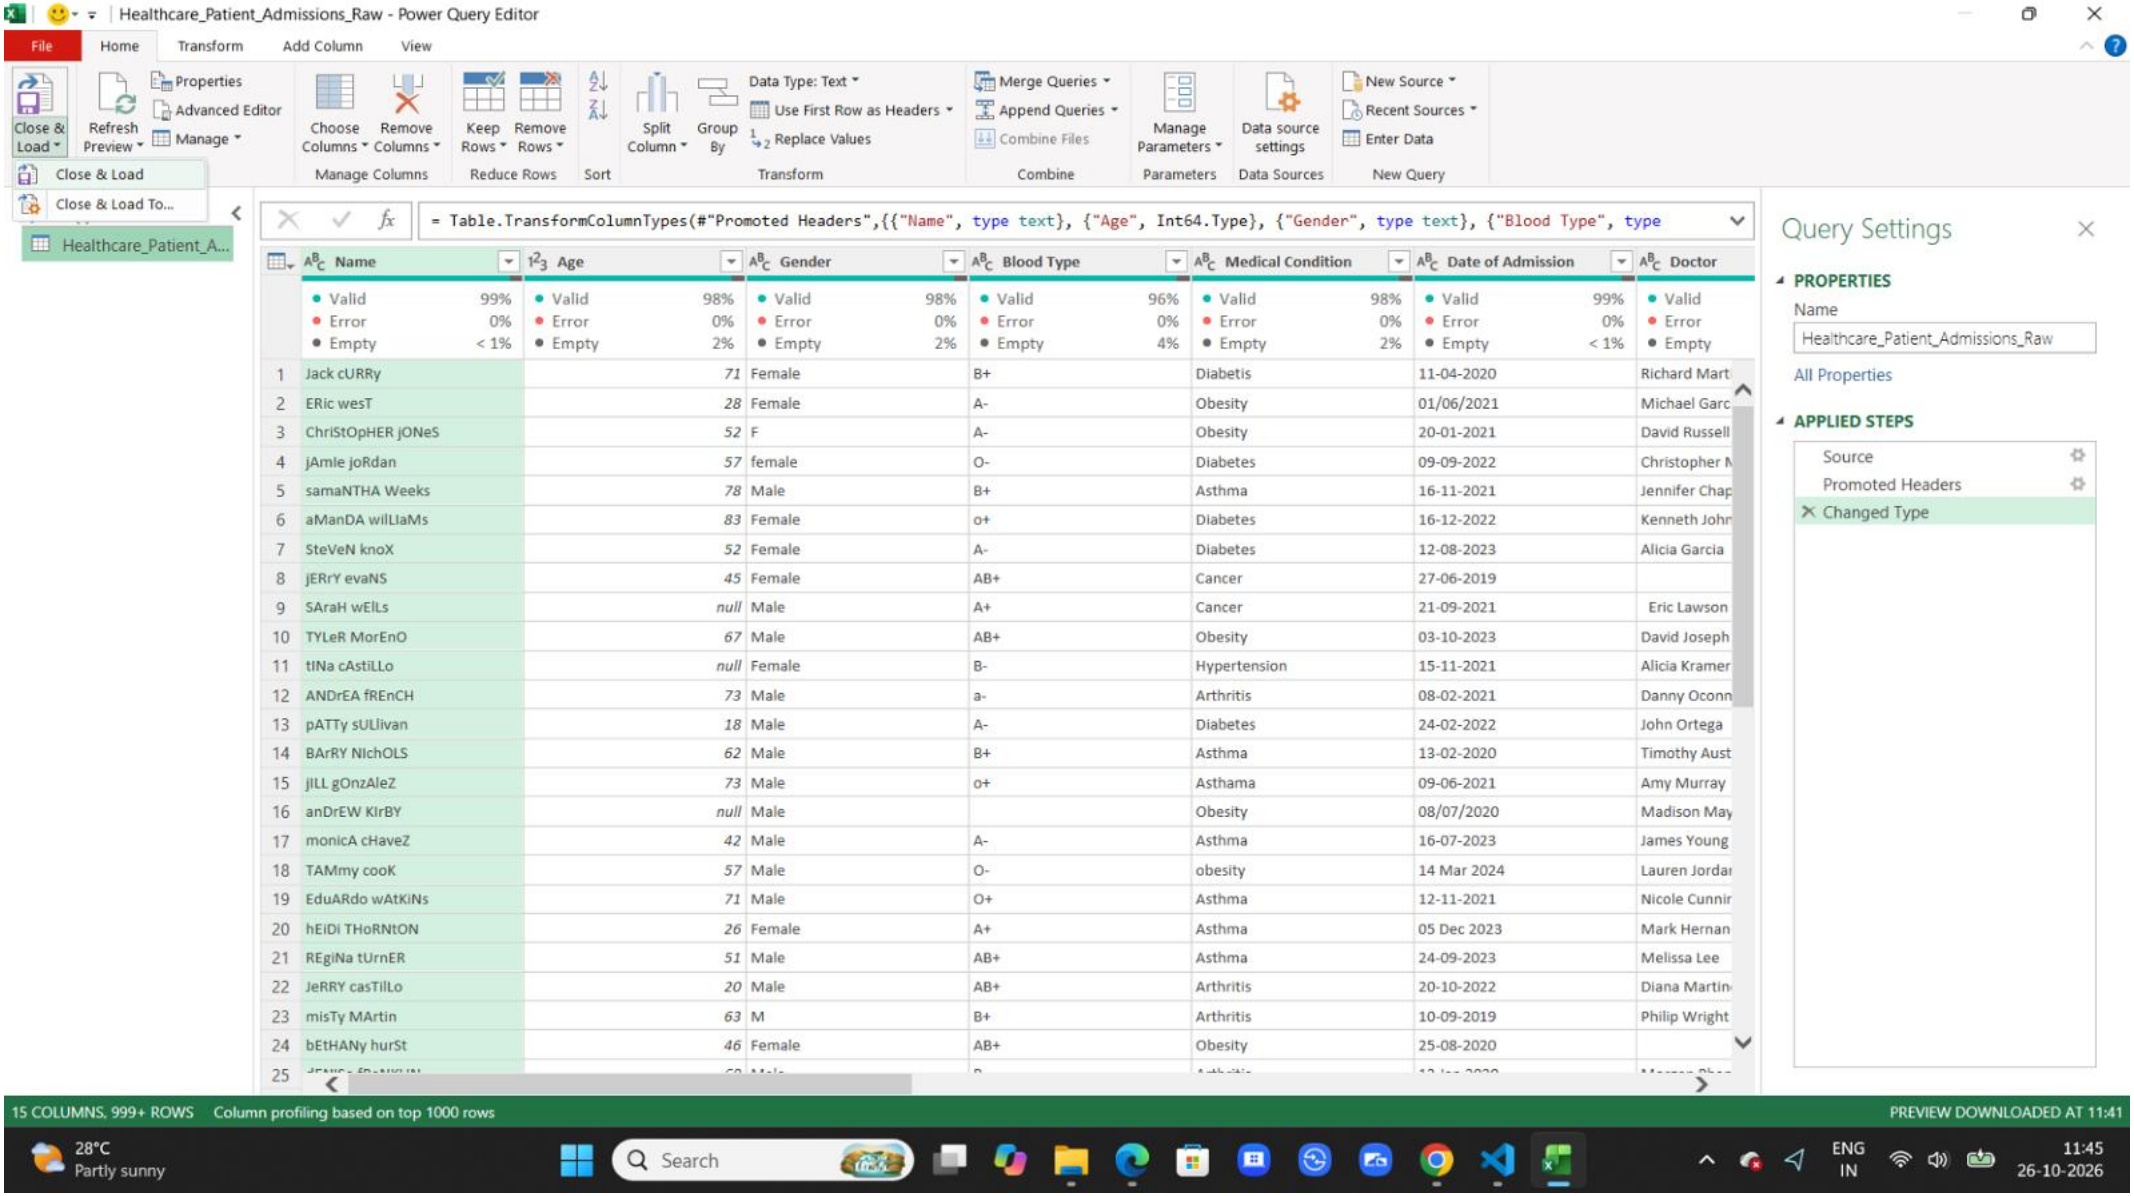

Step 3: Open the dataset in Power Query

Observation: Opened the imported dataset in Power Query Editor to inspect the data before beginning the cleaning checks.

Step 4: Review the dataset in Power Query

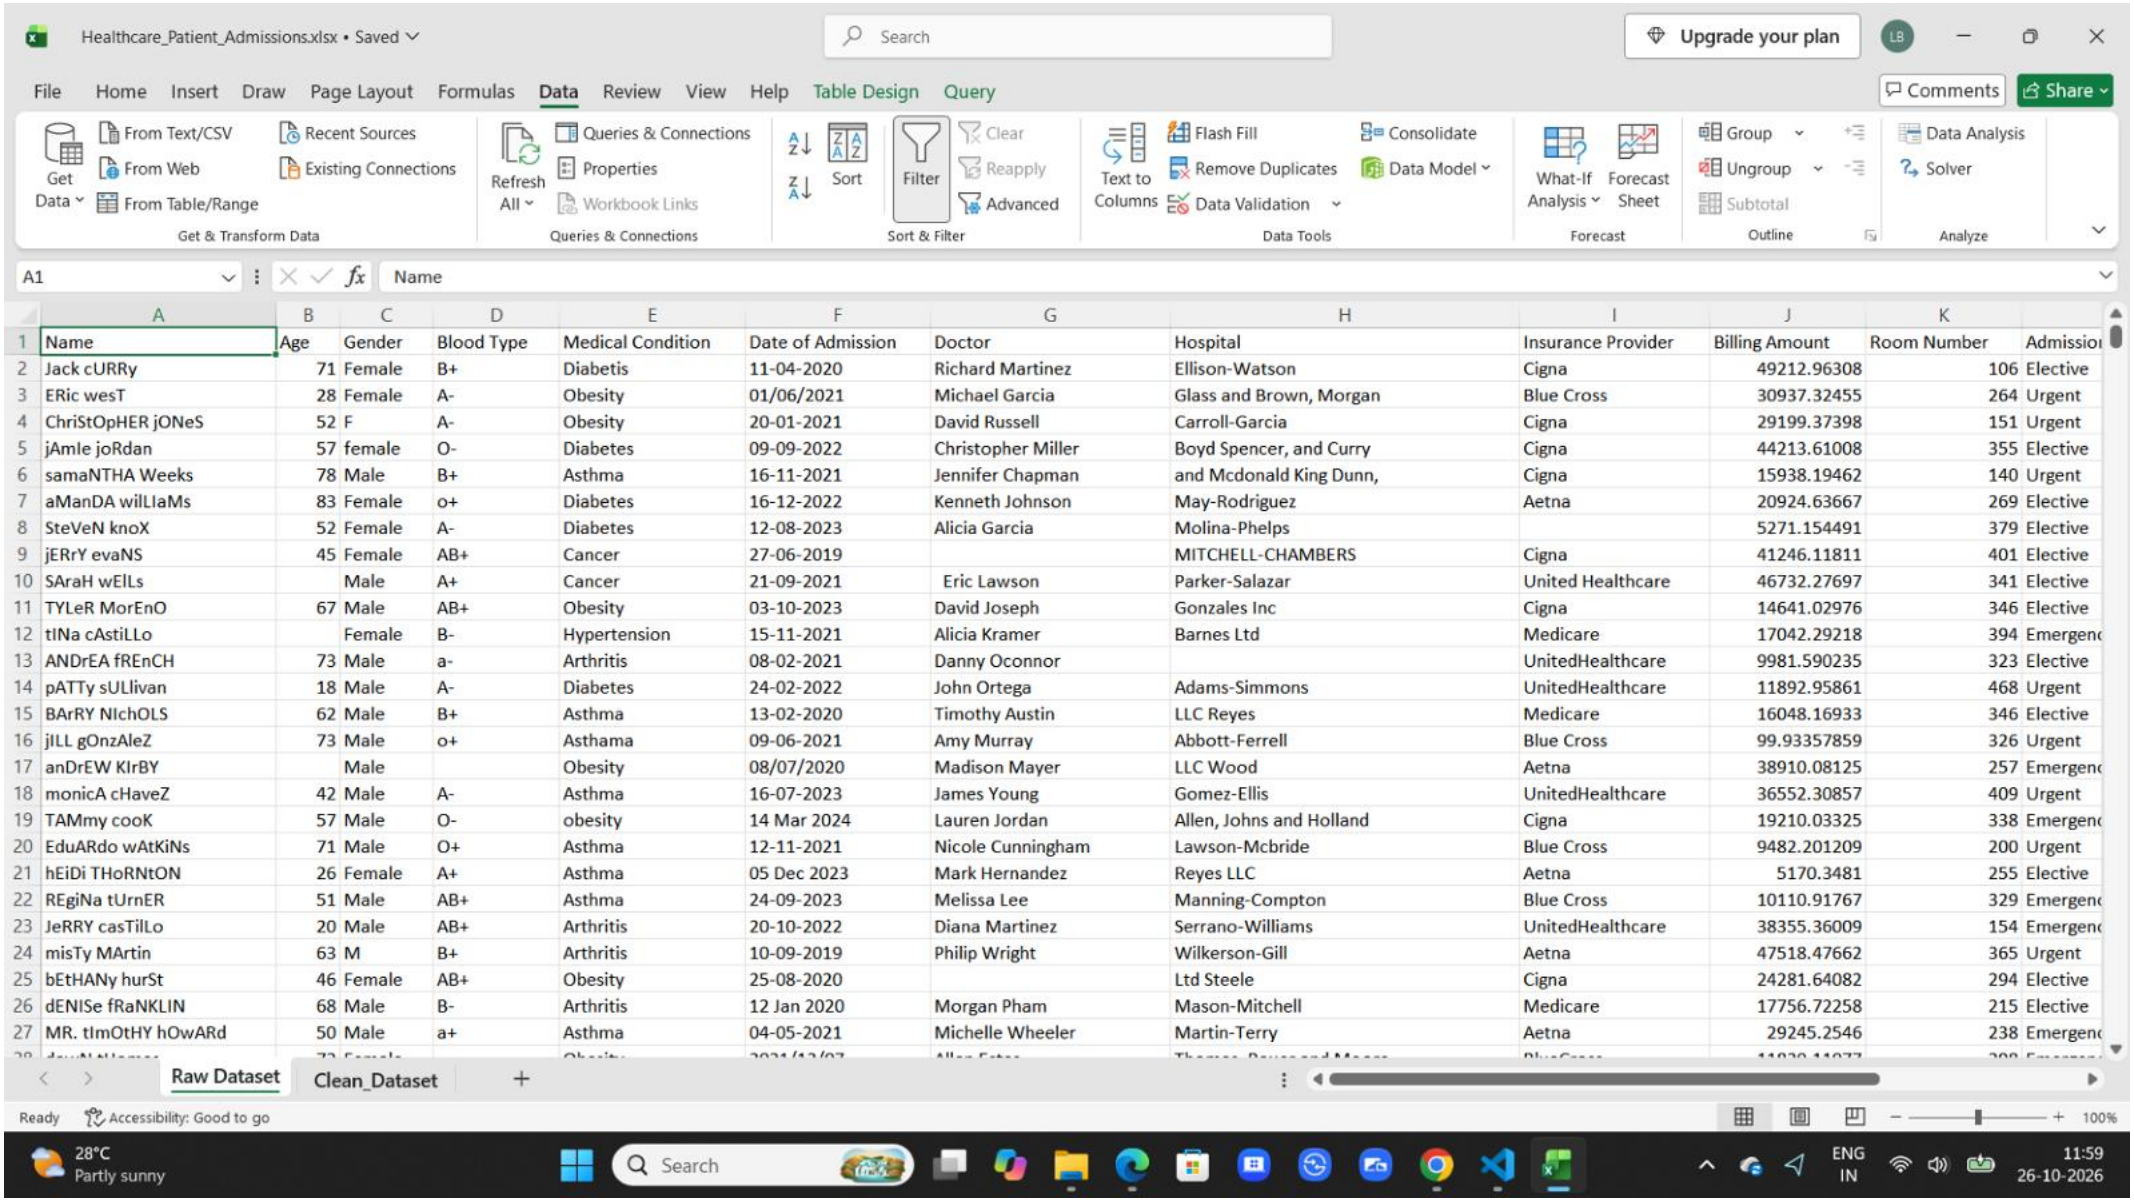

Observation: Inspected the data preview and the available columns as an initial check before continuing in Excel.

Step 7: View records with blank Name values

Observation: Applied the blank filter to the Name column to display the records where Name is empty. This helps identify how many records need attention before deciding how to handle them.

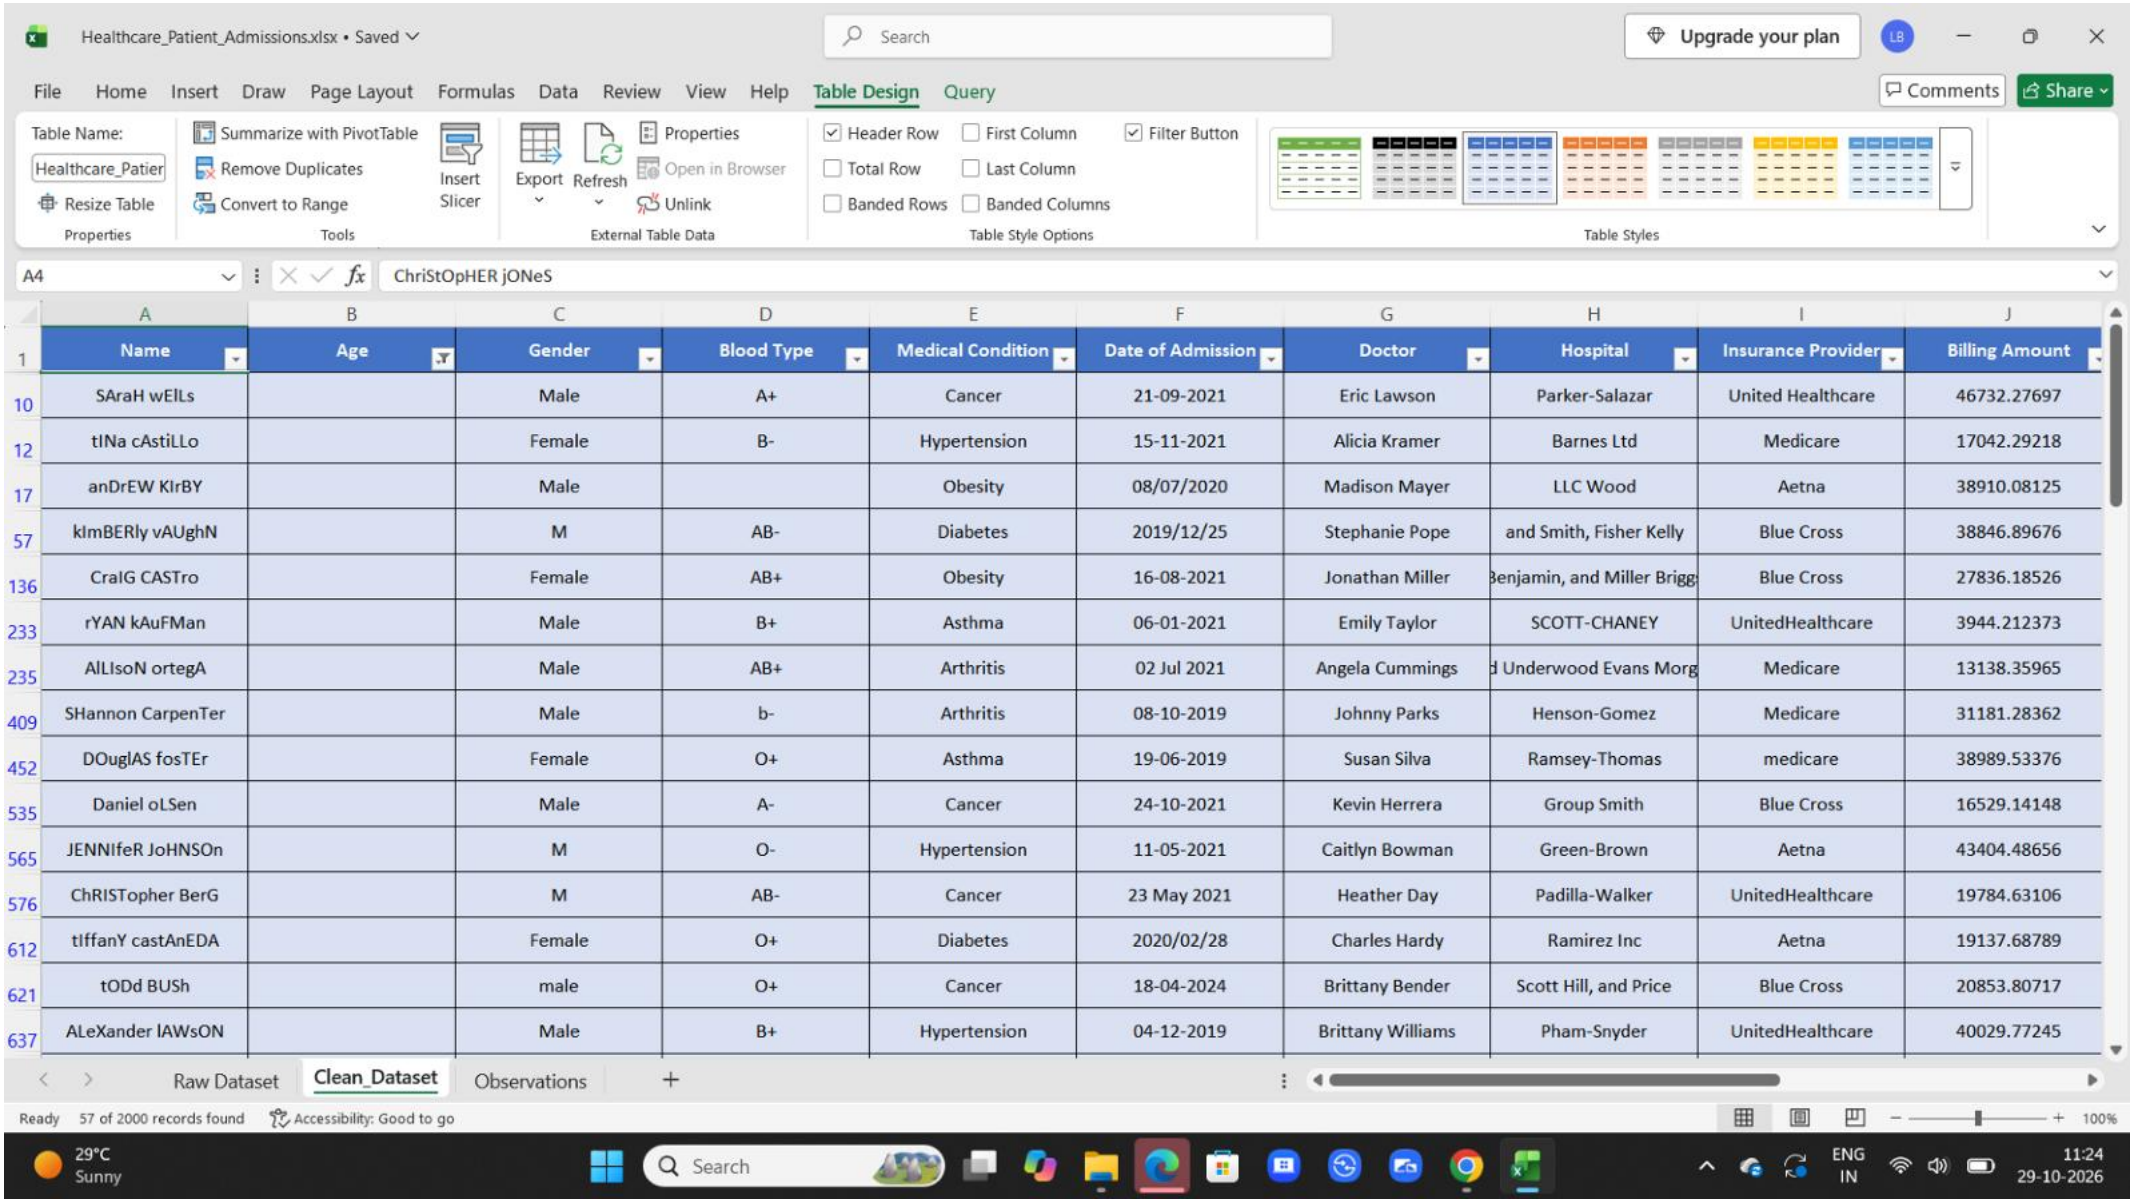

Step 8: Check blank cells in the Age column

Observation: Opened the Age column filter and selected the “(Blanks)” option to check for records with an empty Age value.

Step 9: View records with blank Age values

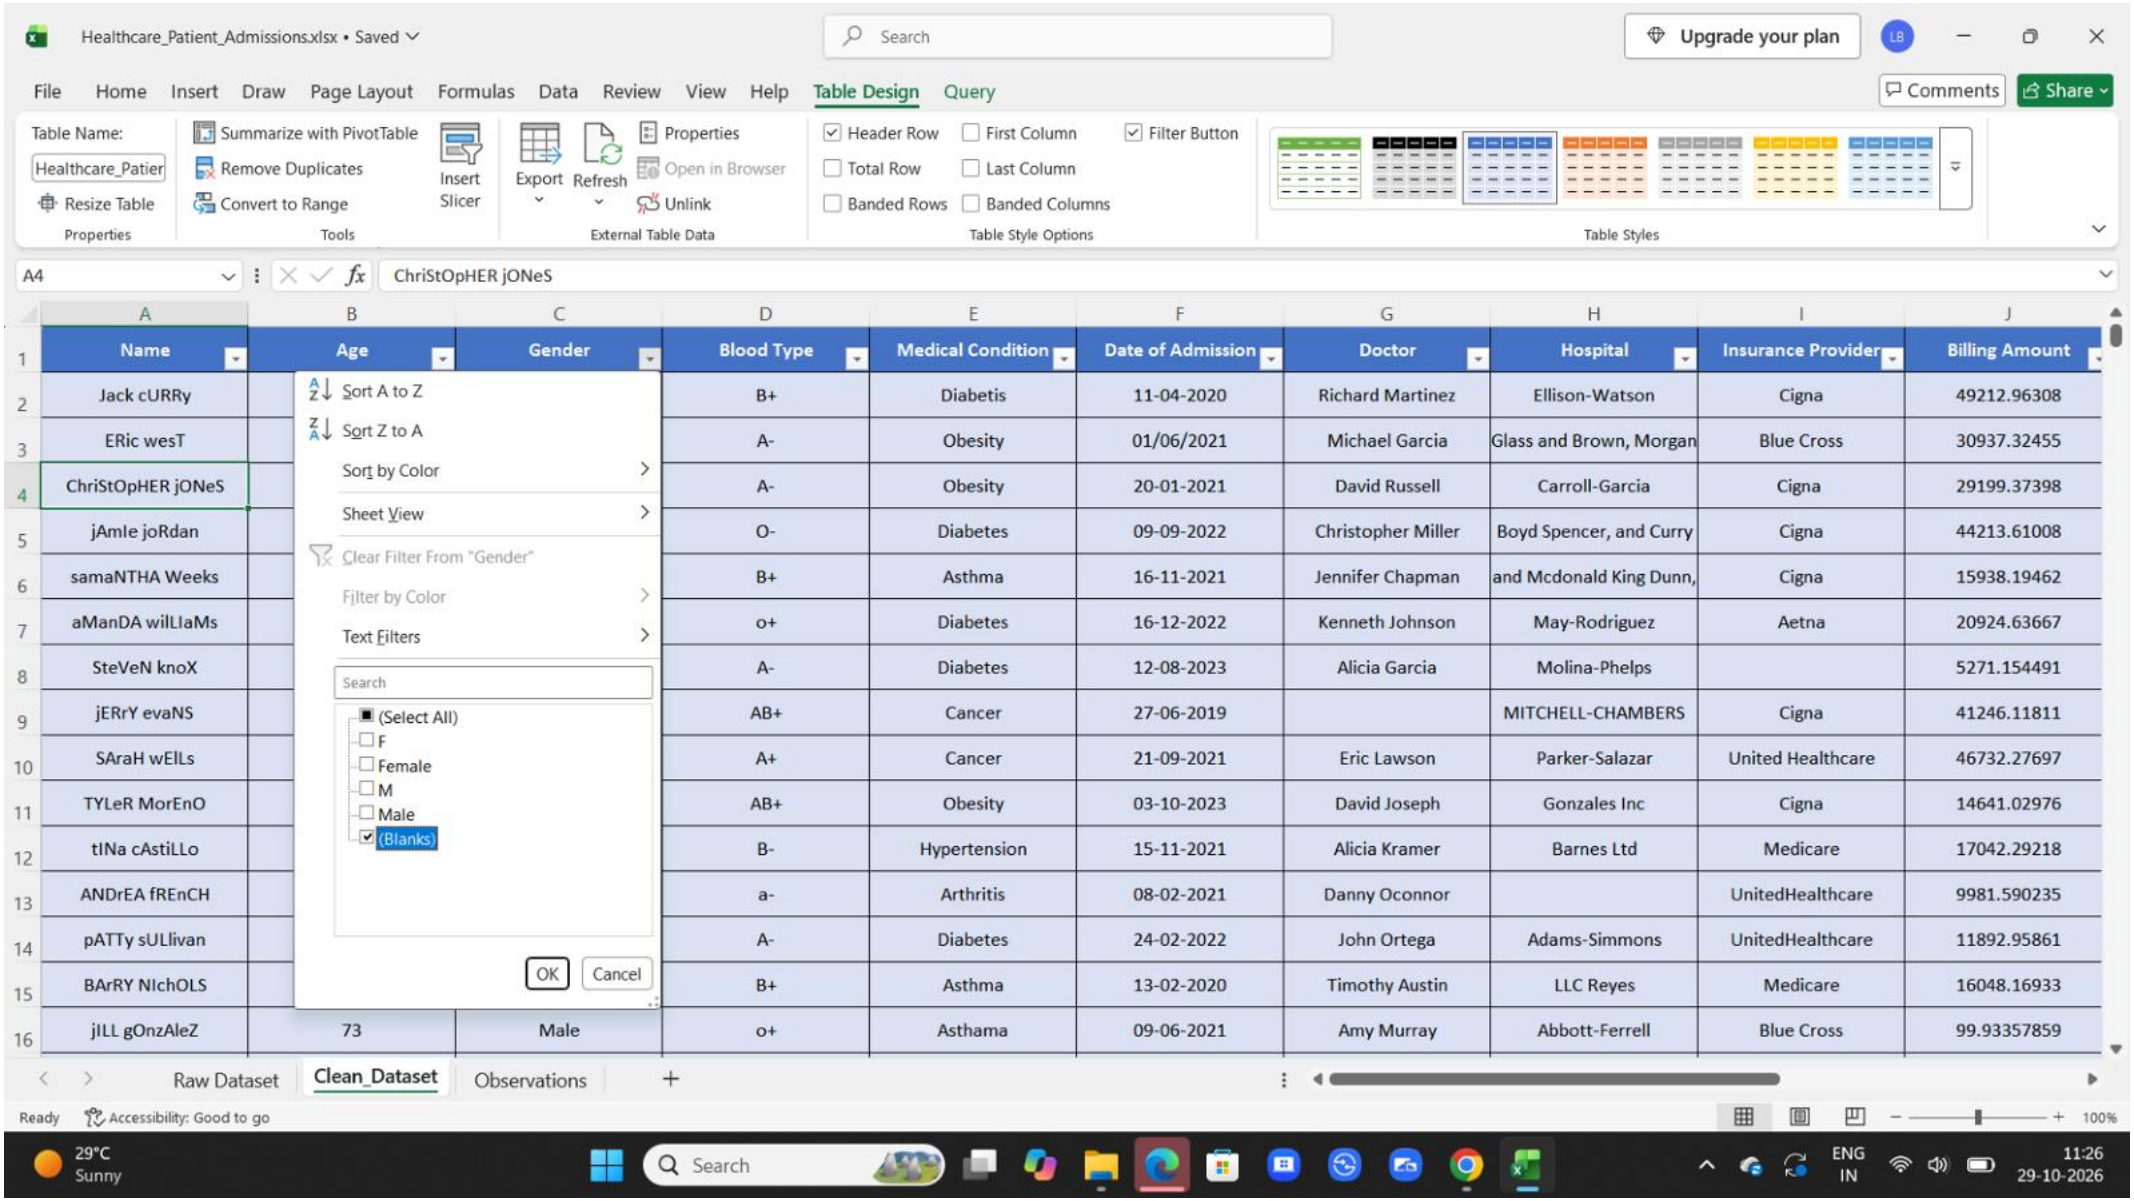

Observation: Applied the blank filter to the Age column to display records where Age is empty. This view helps identify the affected records; it does not by itself show that the blanks were deleted or filled.

Step 36 – Check for Duplicate Records

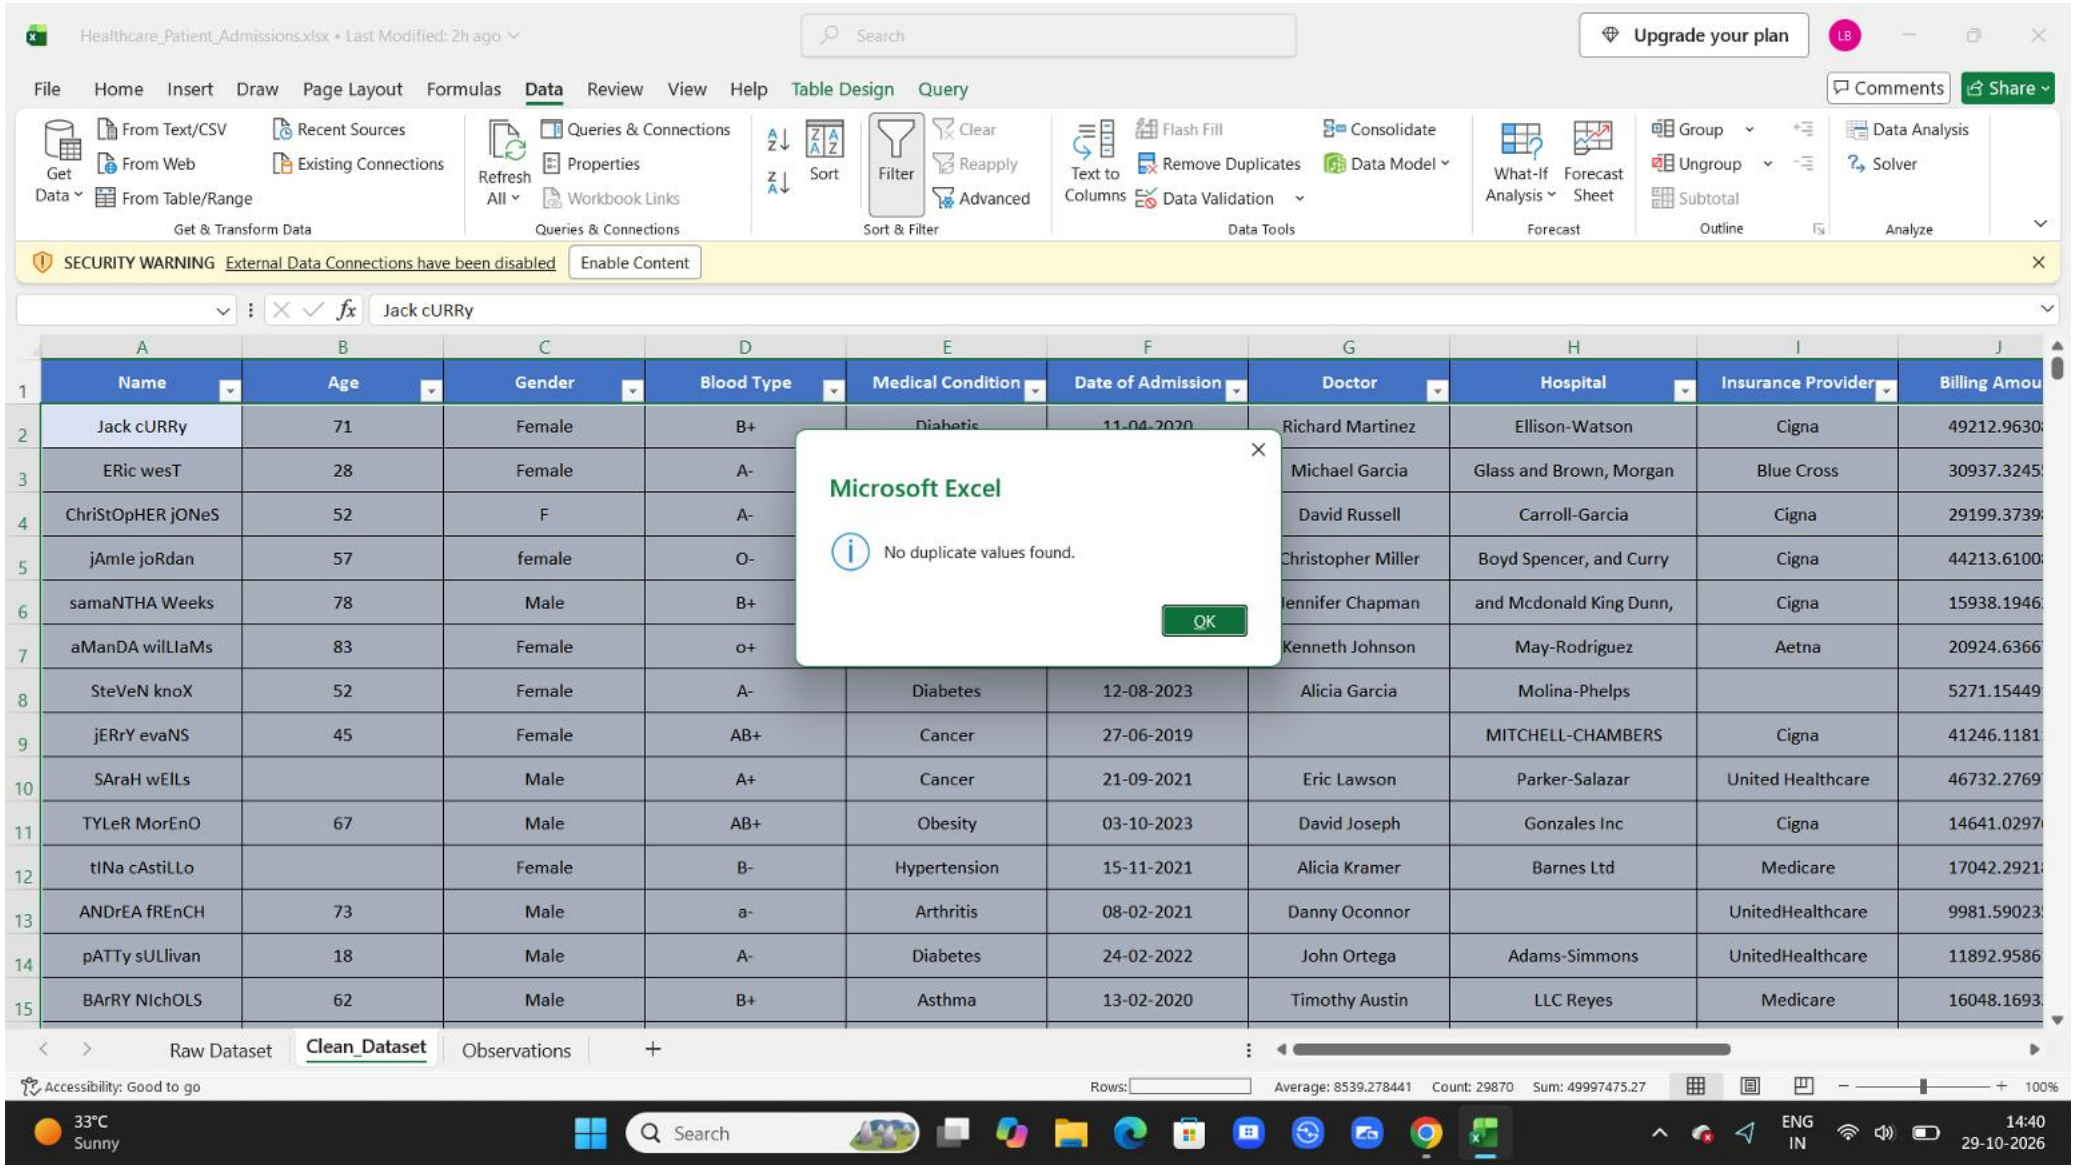

Observation: Opened Excel's Remove Duplicates dialog on the Clean_Dataset sheet. Kept "My data has headers" selected and selected all available columns so Excel would check complete rows across the dataset for duplicate values. This step checks for duplicates; it does not itself confirm that any rows were removed.

Step 37 – Review the Duplicate Check Result

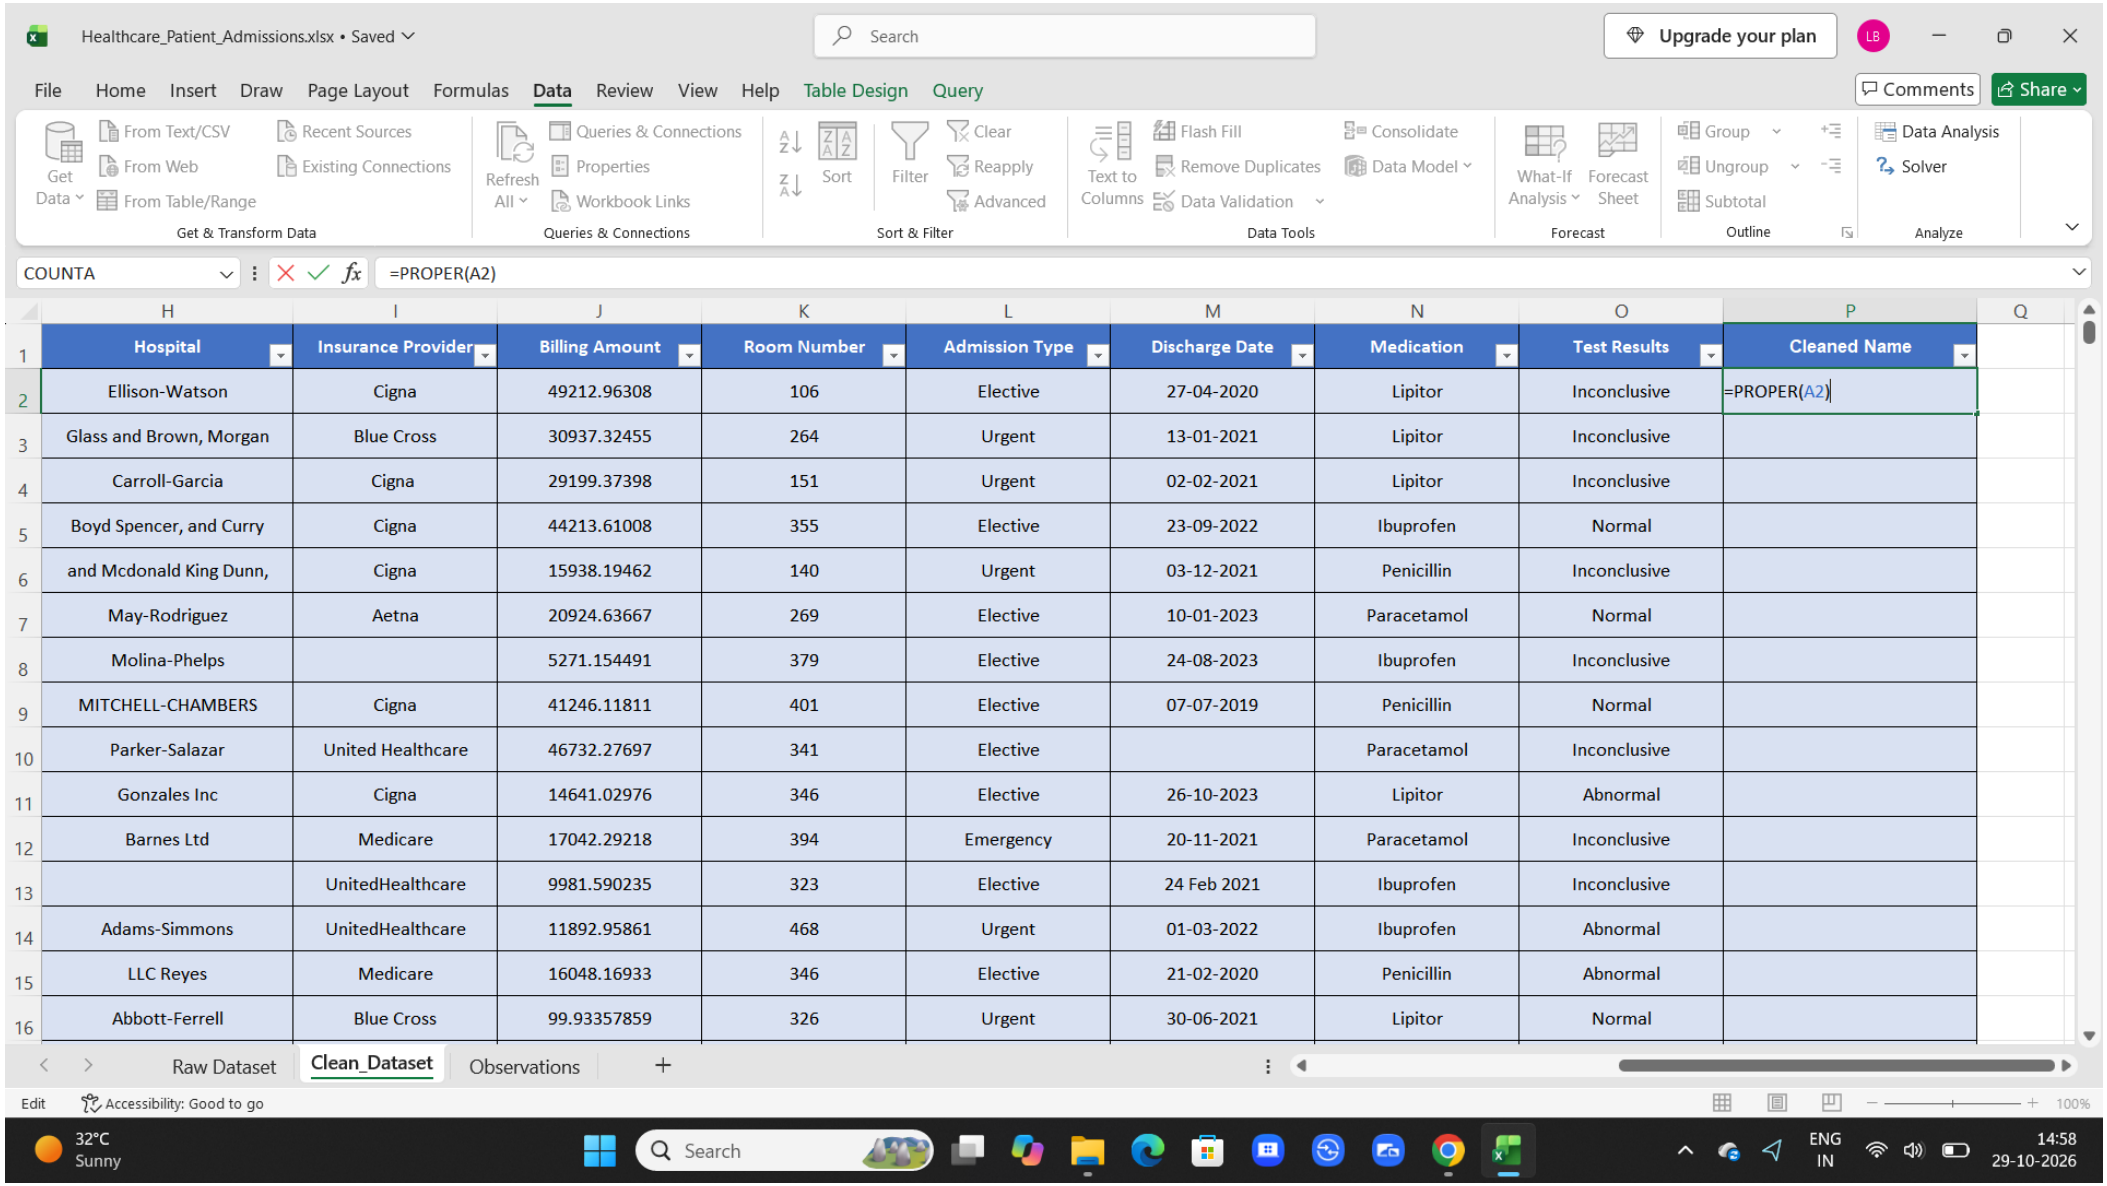

Observation: Excel displayed “No duplicate values found.” Based on the selected columns, Excel did not find any duplicate records, so no duplicate rows were removed by this check.

Step 38 – Create a Cleaned Name Column

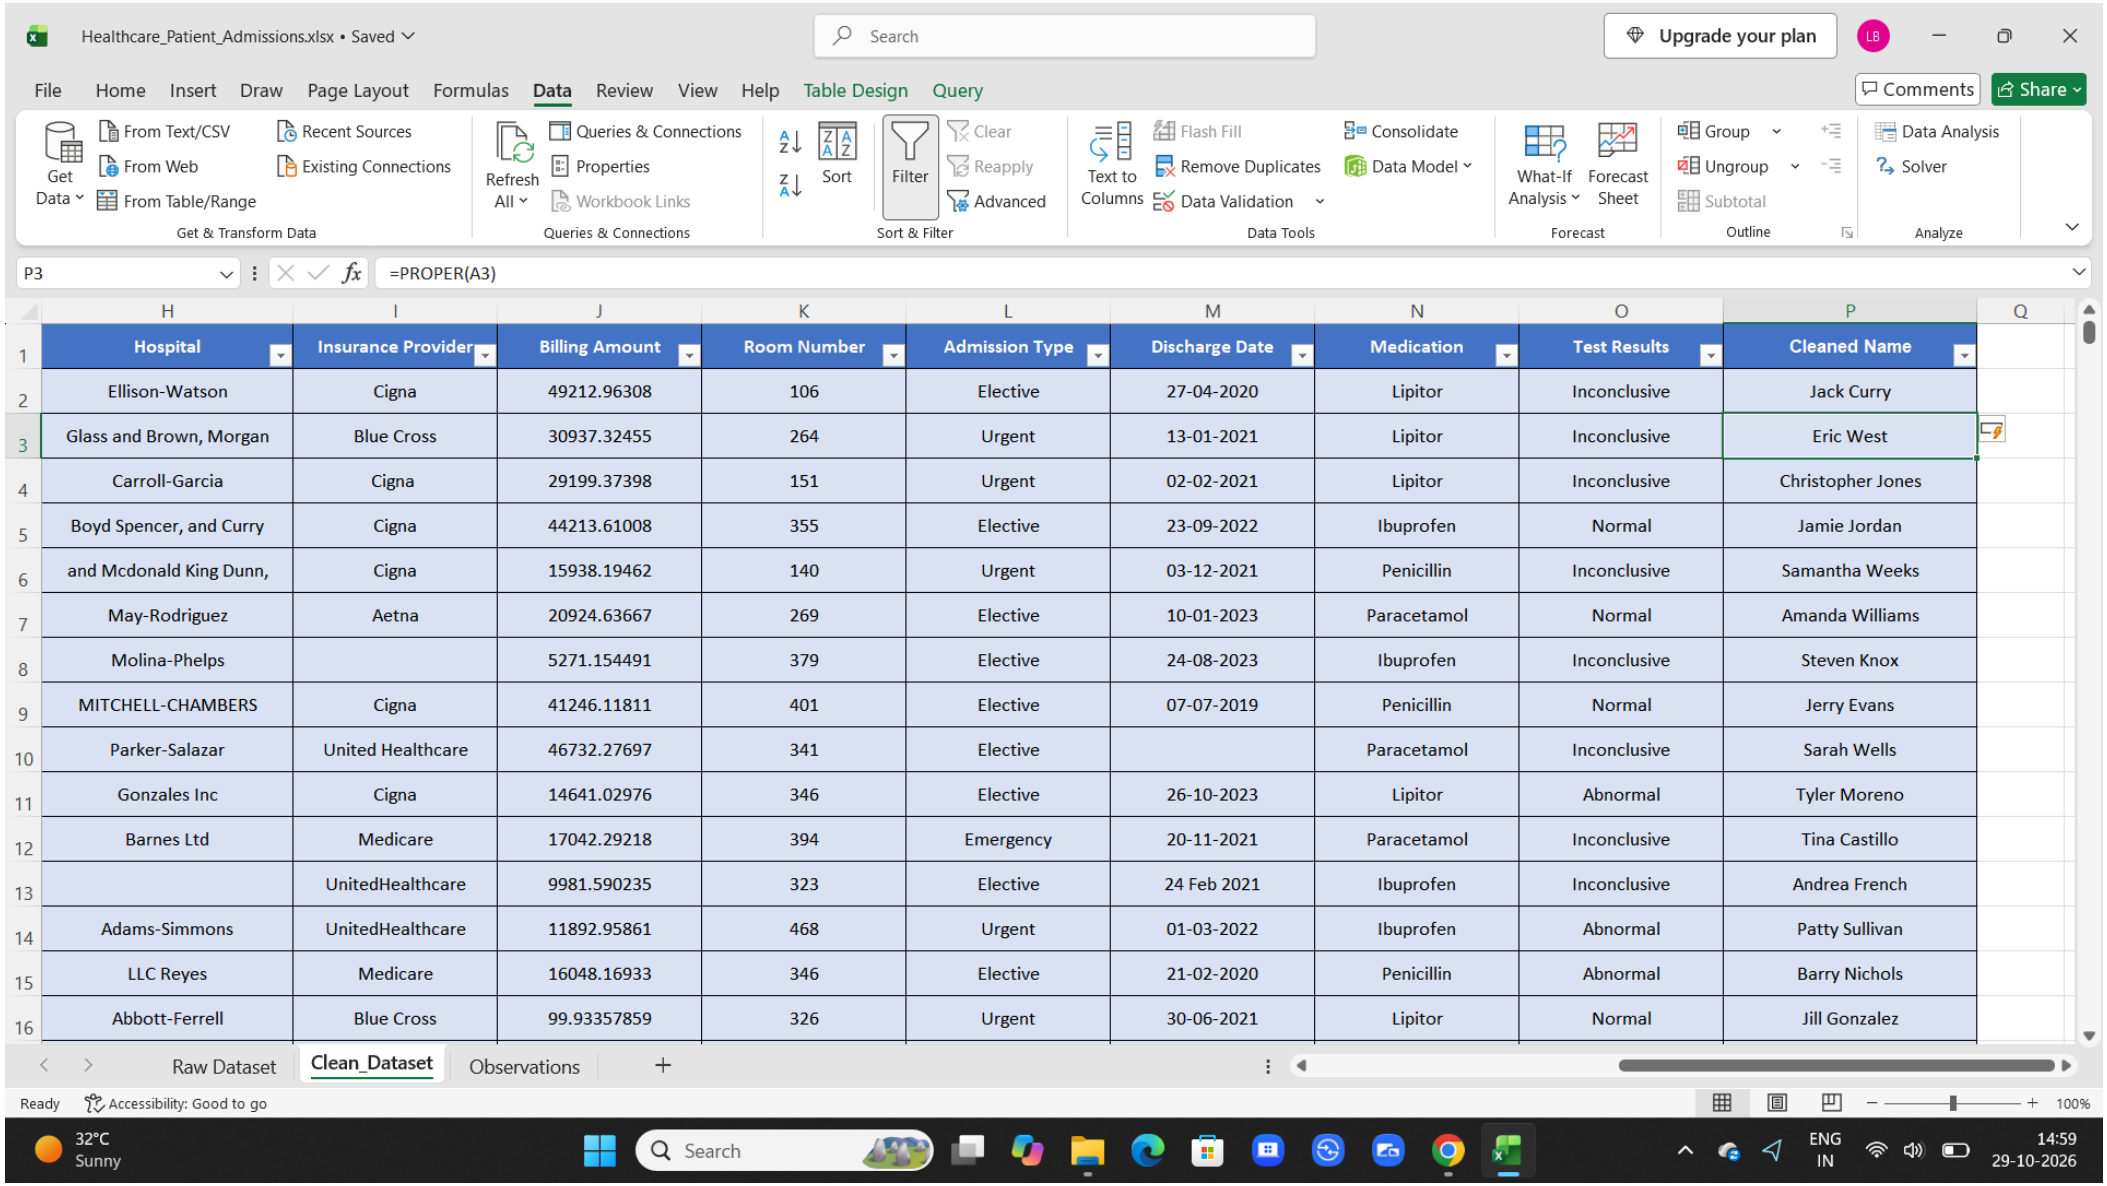

Observation: Entered the PROPER() formula in the new Cleaned Name column, using the original Name cell as the reference. This formula converts names to proper case, capitalizing the first letter of each word.

	H	I	J	K	L	M	N	O	P	Q

Step 39 – Apply the Formula to the Names

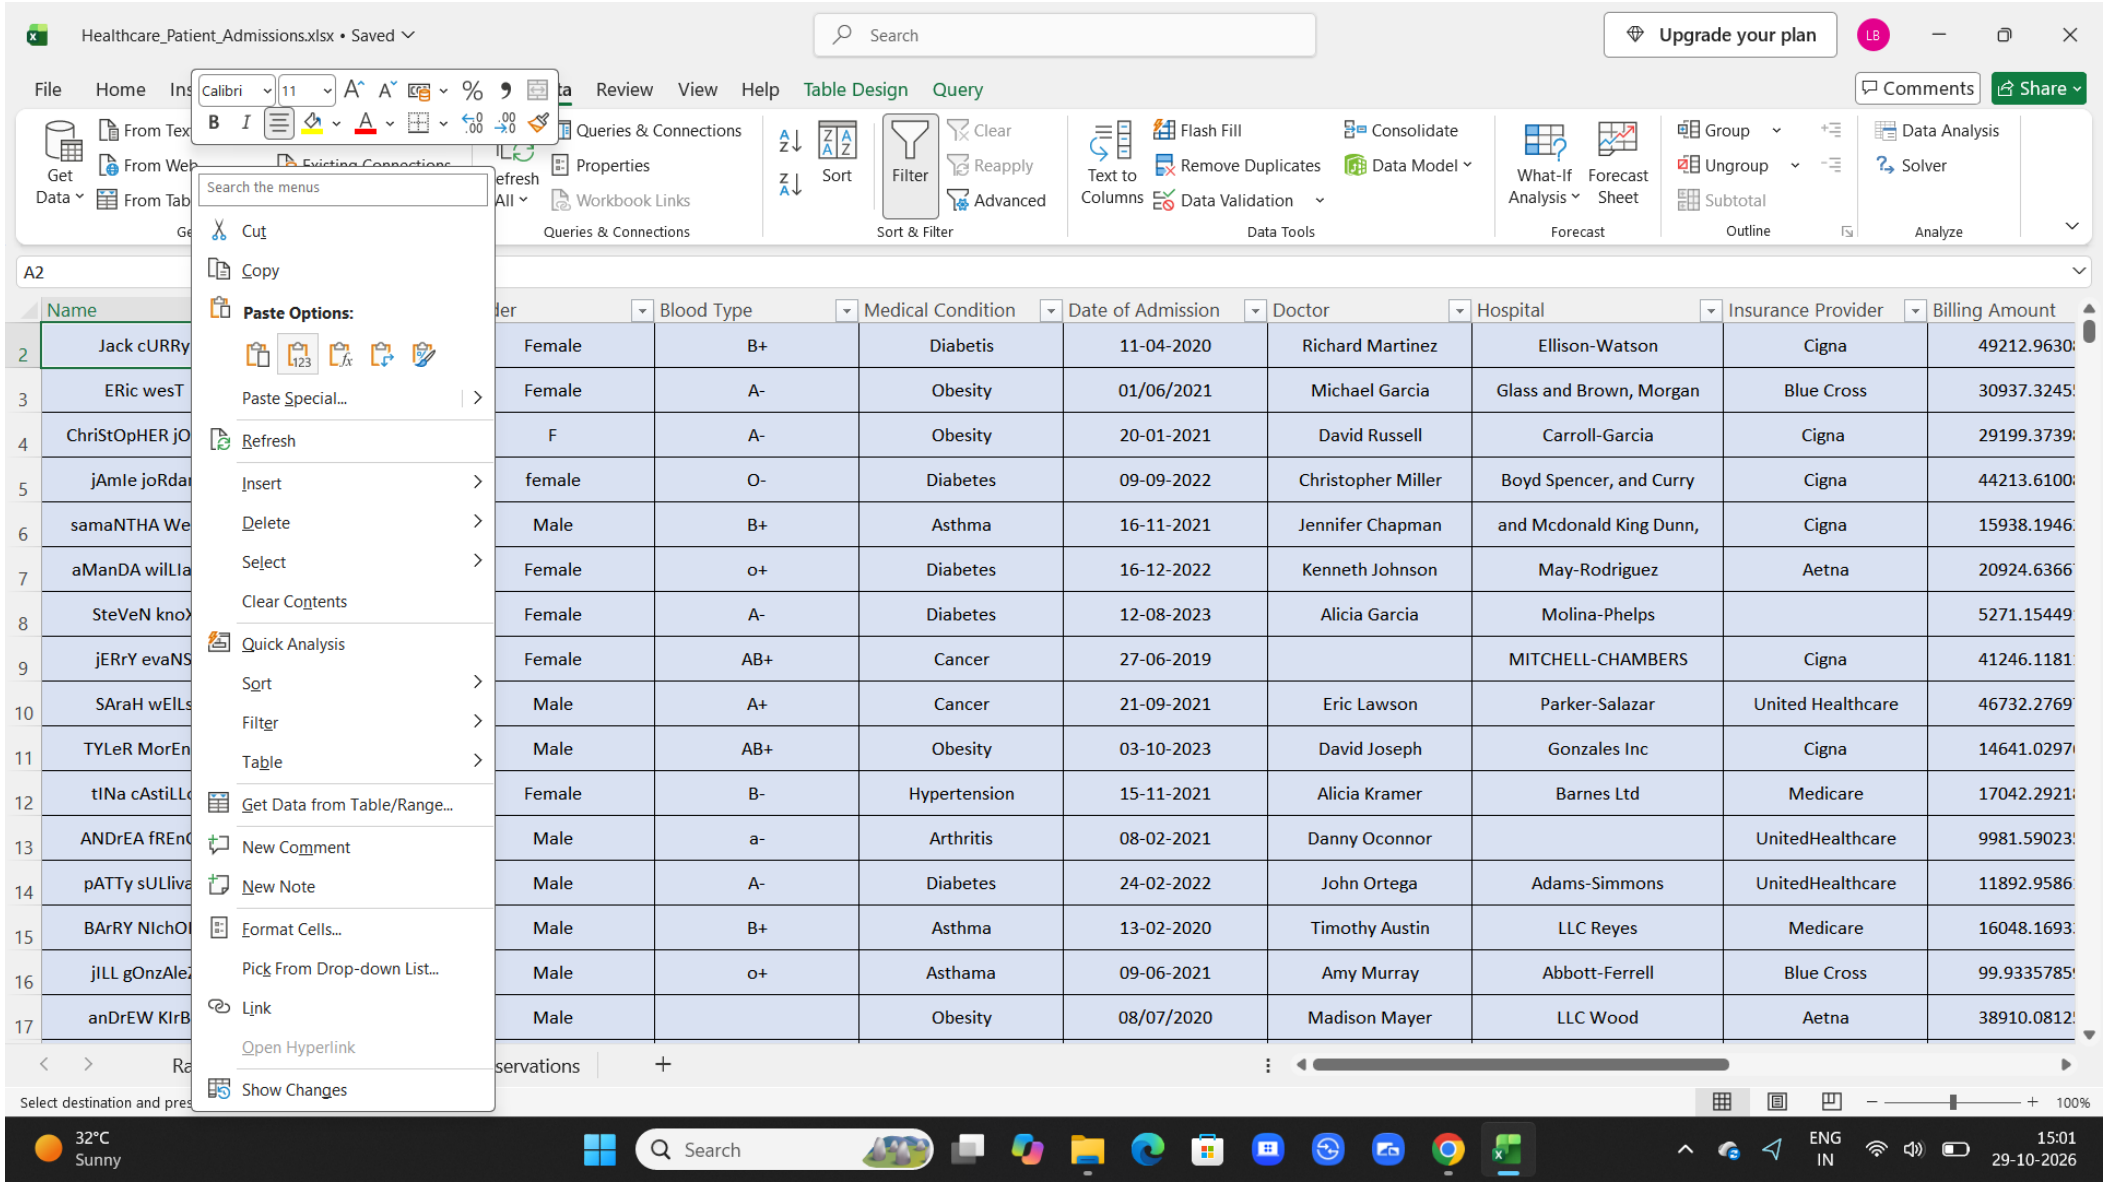

Observation: Filled the PROPER() formula down the Cleaned Name column. The displayed results show names converted to consistent proper-case formatting, such as “Jack Curry” and “Eric West.”

Hospital	Insurance Provider	Billing Amount	Room Number	Admission Type	Discharge Date	Medication	Test Results	Cleaned Name

Step 40 – Copy the Cleaned Names

Observation: Selected the cleaned name results and prepared to copy them to the original Name column. This step transfers the standardized names back into the main dataset.

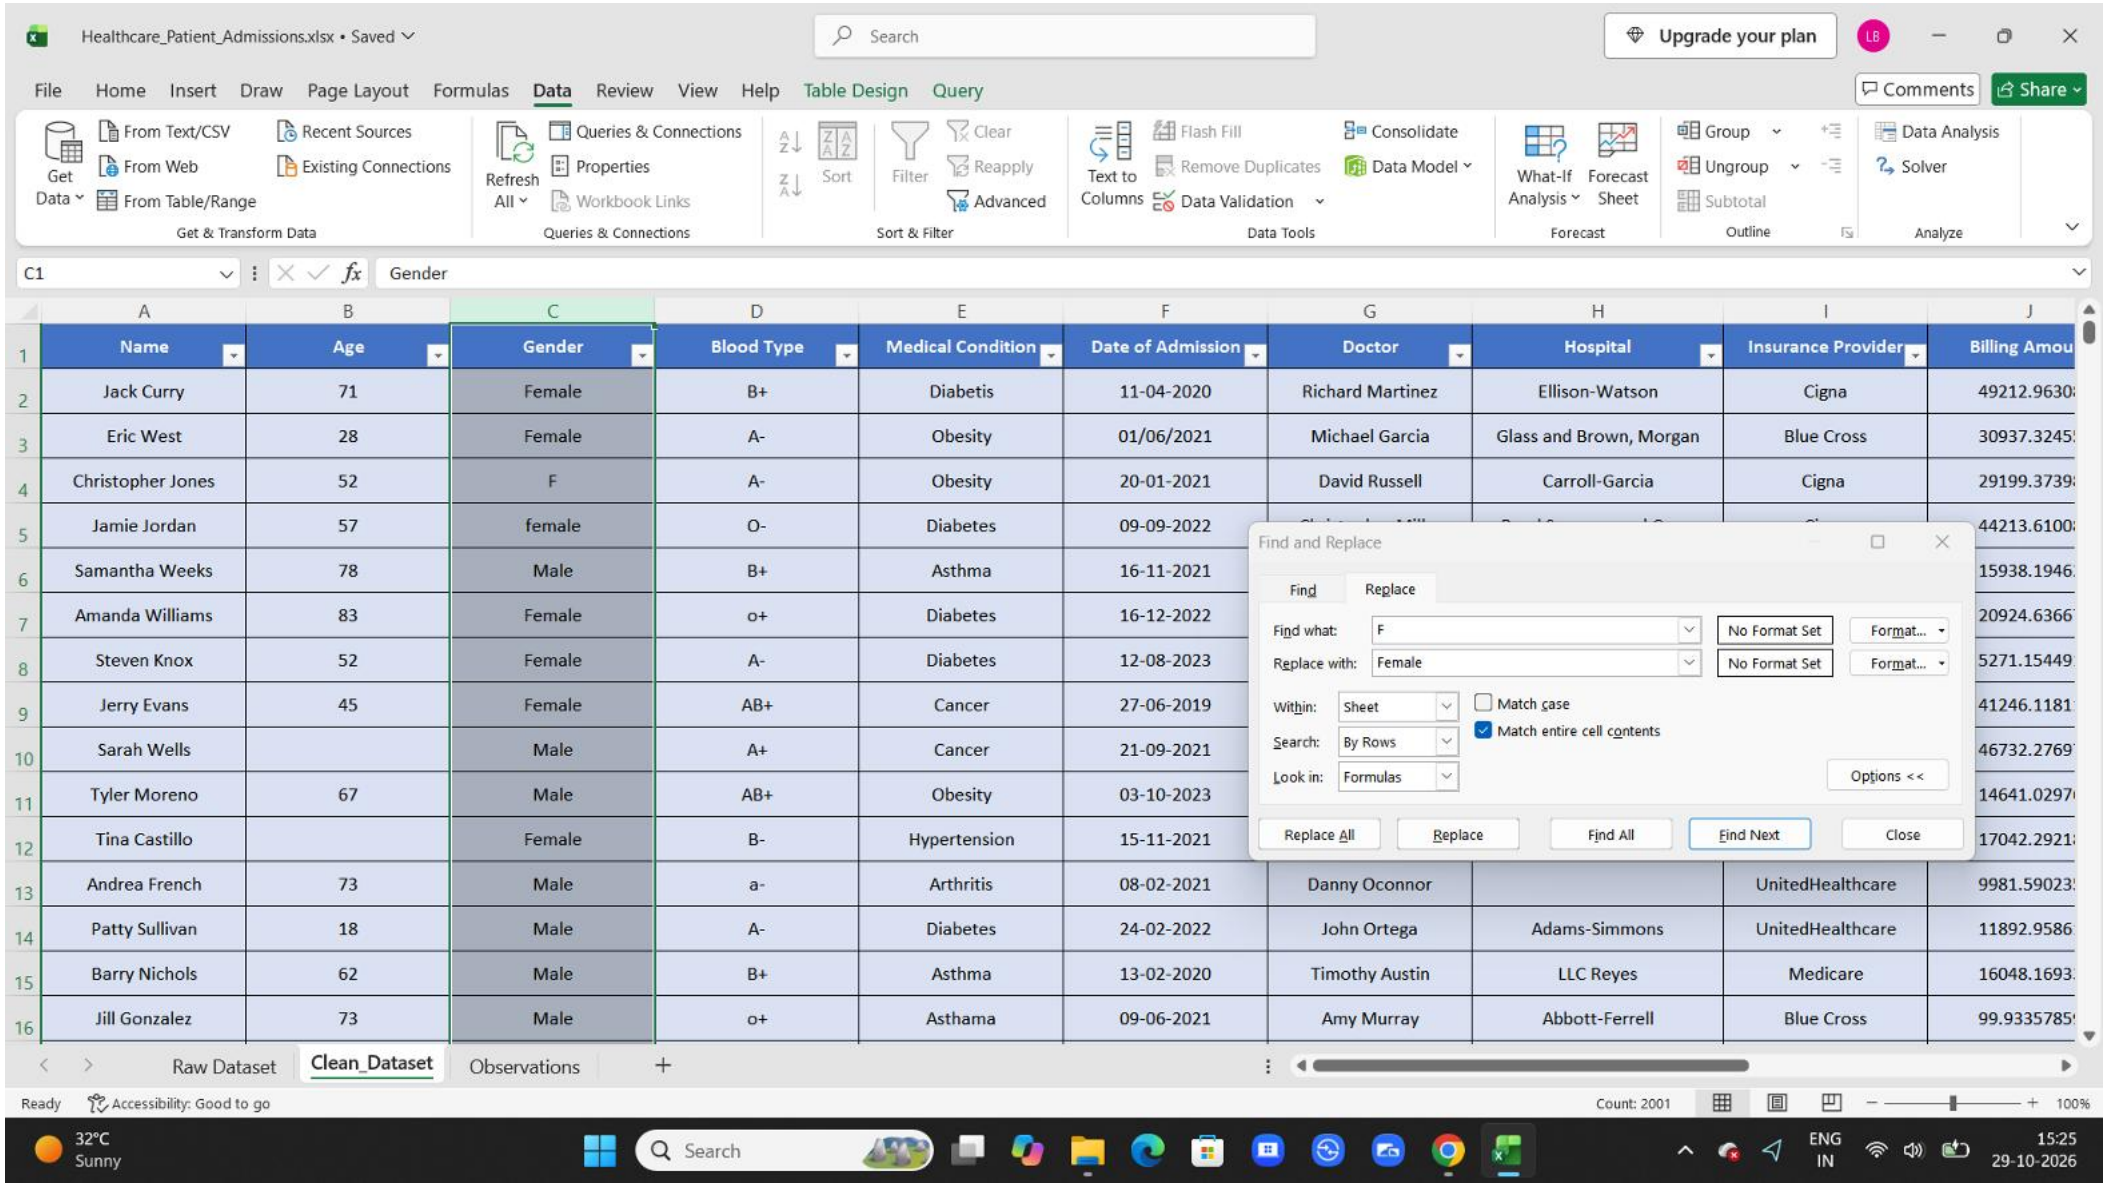

Step 41 – Verify the Standardized Name Values

Observation: Reviewed the Name column after pasting the cleaned results. The visible names now use consistent proper-case formatting, improving readability and consistency in the dataset.

Step 42 – Standardize Short Gender Values

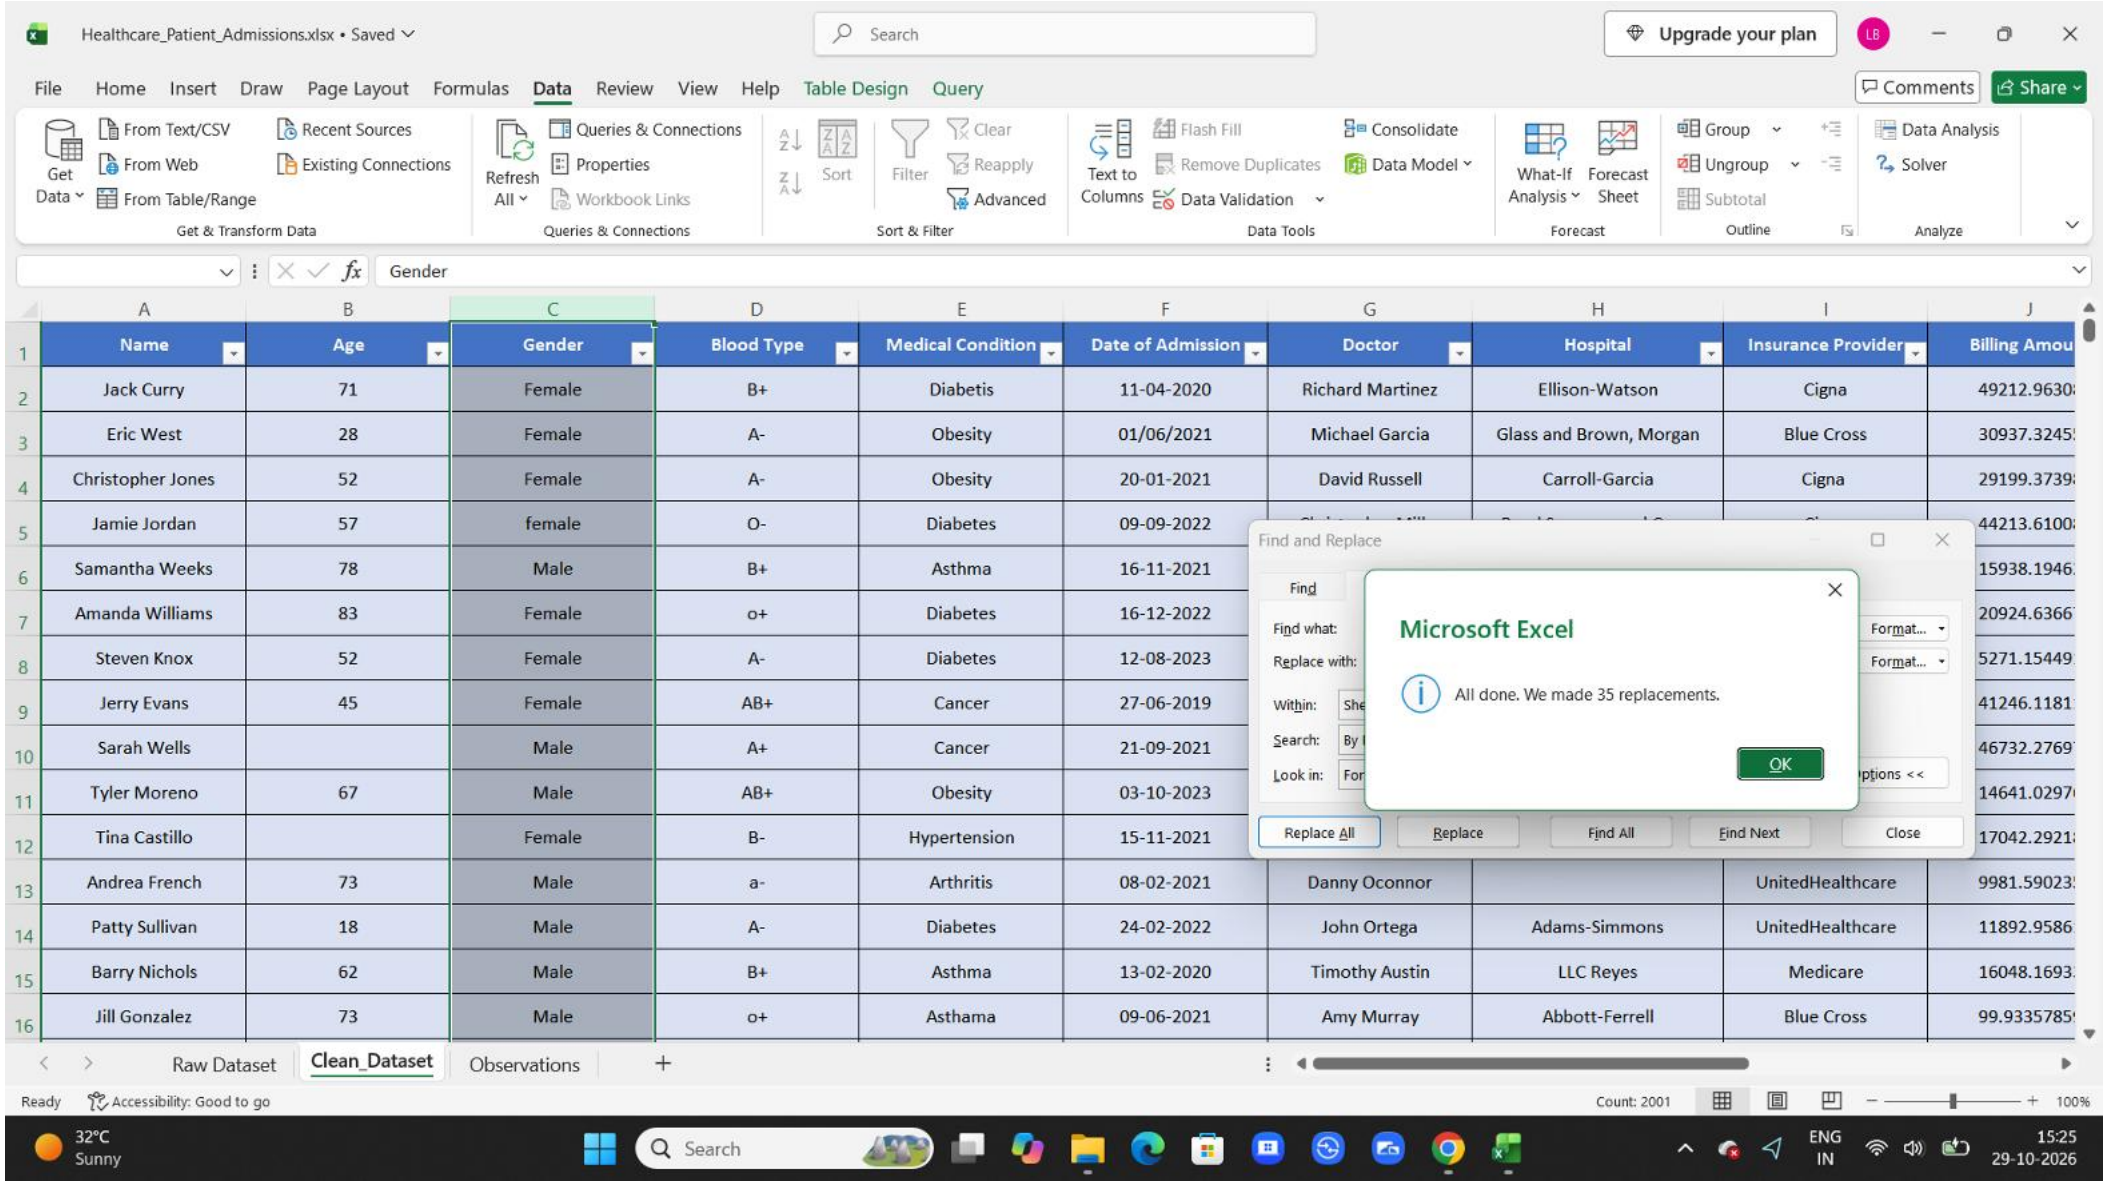

Observation: Used Find and Replace on the Gender column to find the exact cell value “F” and replace it with “Female”. The “Match entire cell contents” option was selected to avoid replacing text within longer values.

	Name	Age	Gender	Blood Type	Medical Condition	Date of Admission	Doctor	Hospital	Insurance Provider	Billing Amou

Step 43 – Confirm the Gender Replacement

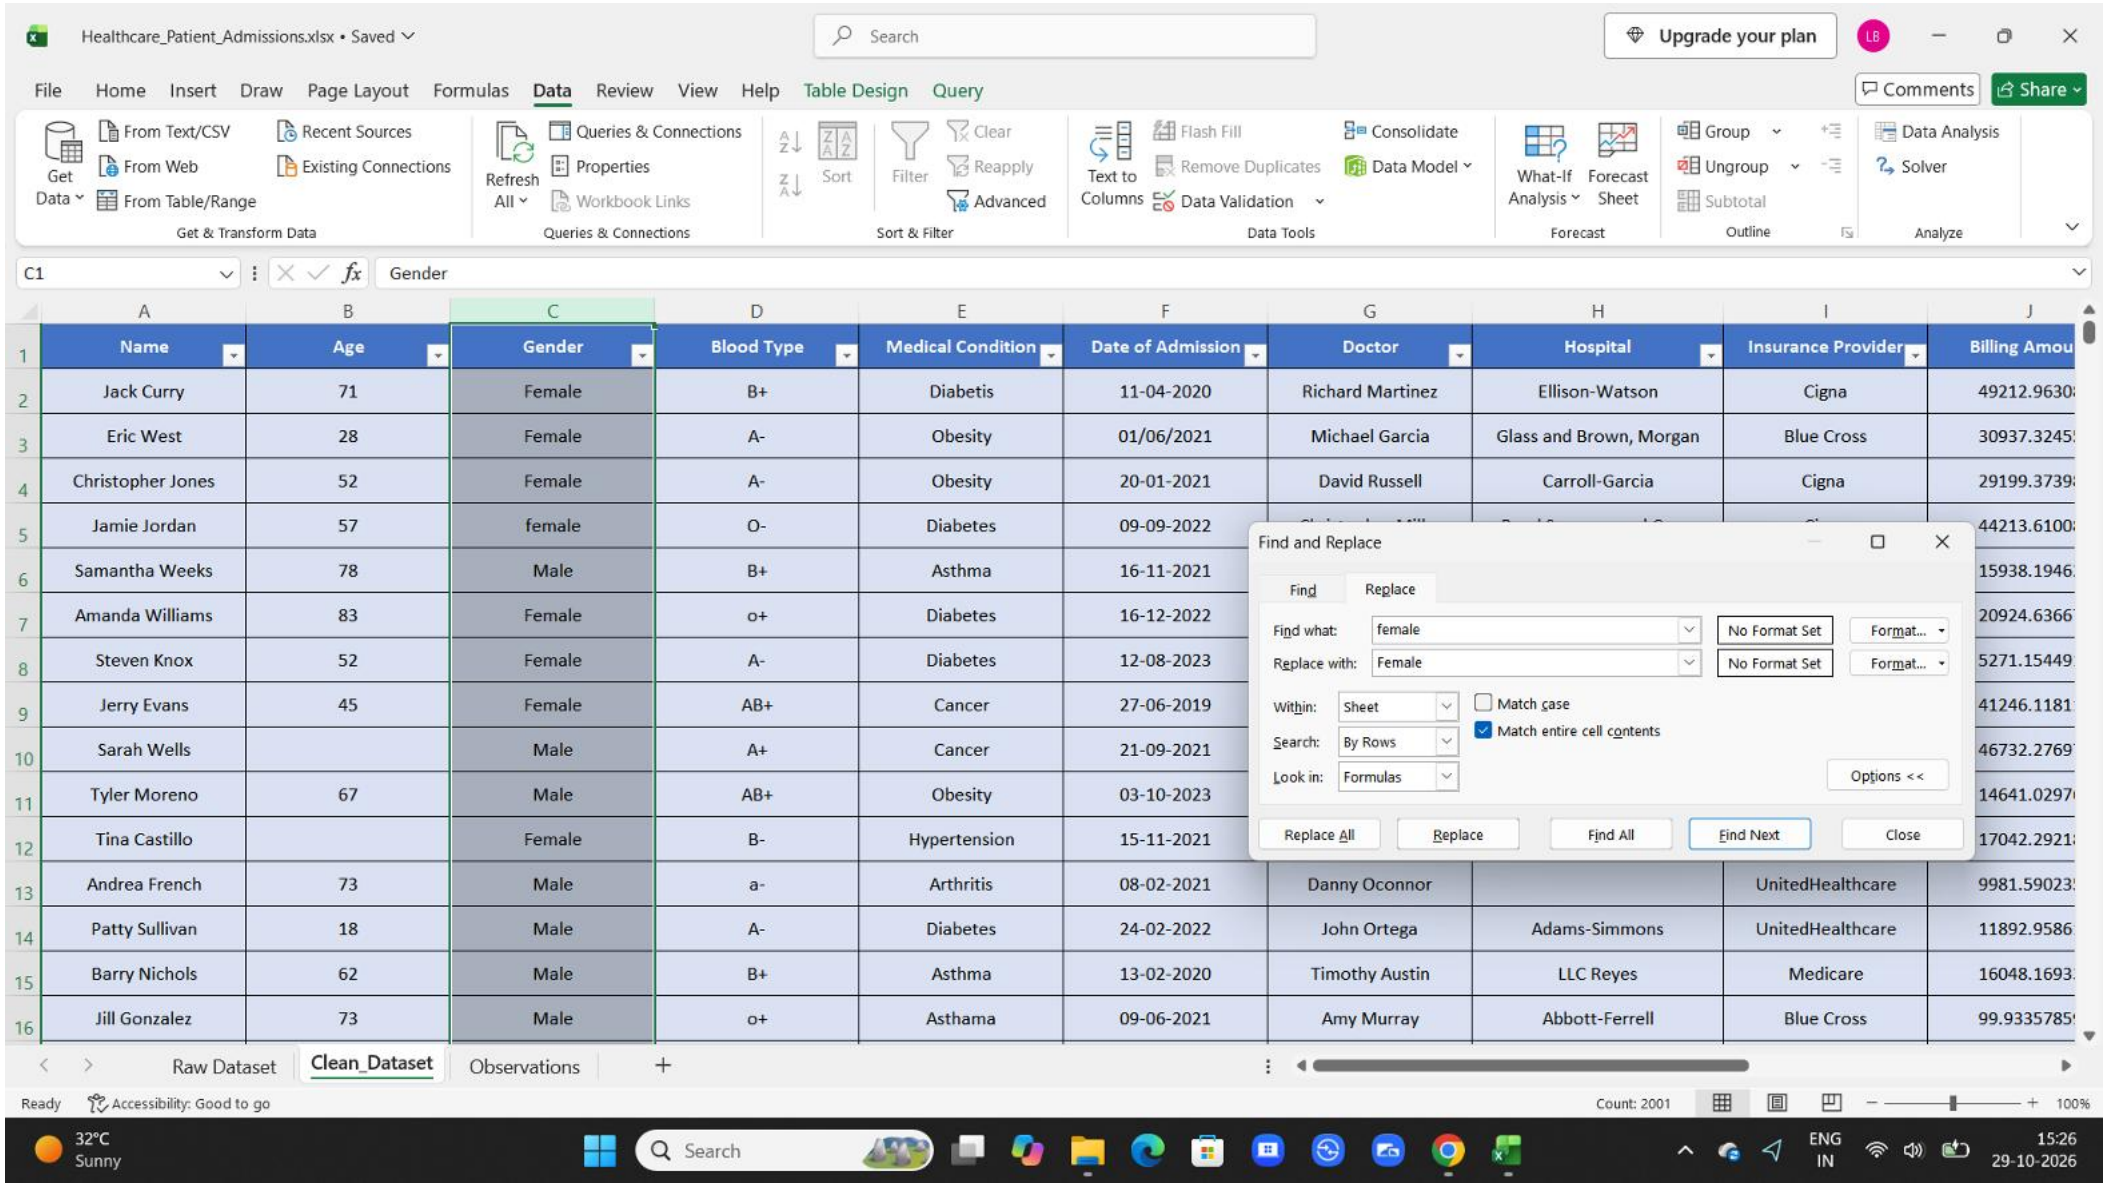

Observation: Excel reported “We made 35 replacements.” This confirms that 35 cells containing the exact value “F” were changed to “Female”.

Name	Age	Gender	Blood Type	Medical Condition	Date of Admission	Doctor	Hospital	Insurance Provider	Billing Amou
Jack Curry	71	Female	B+	Diabetis	11-04-2020	Richard Martinez	Ellison-Watson	Cigna	49212.9630

Step 44 – Standardize Lowercase Gender Values

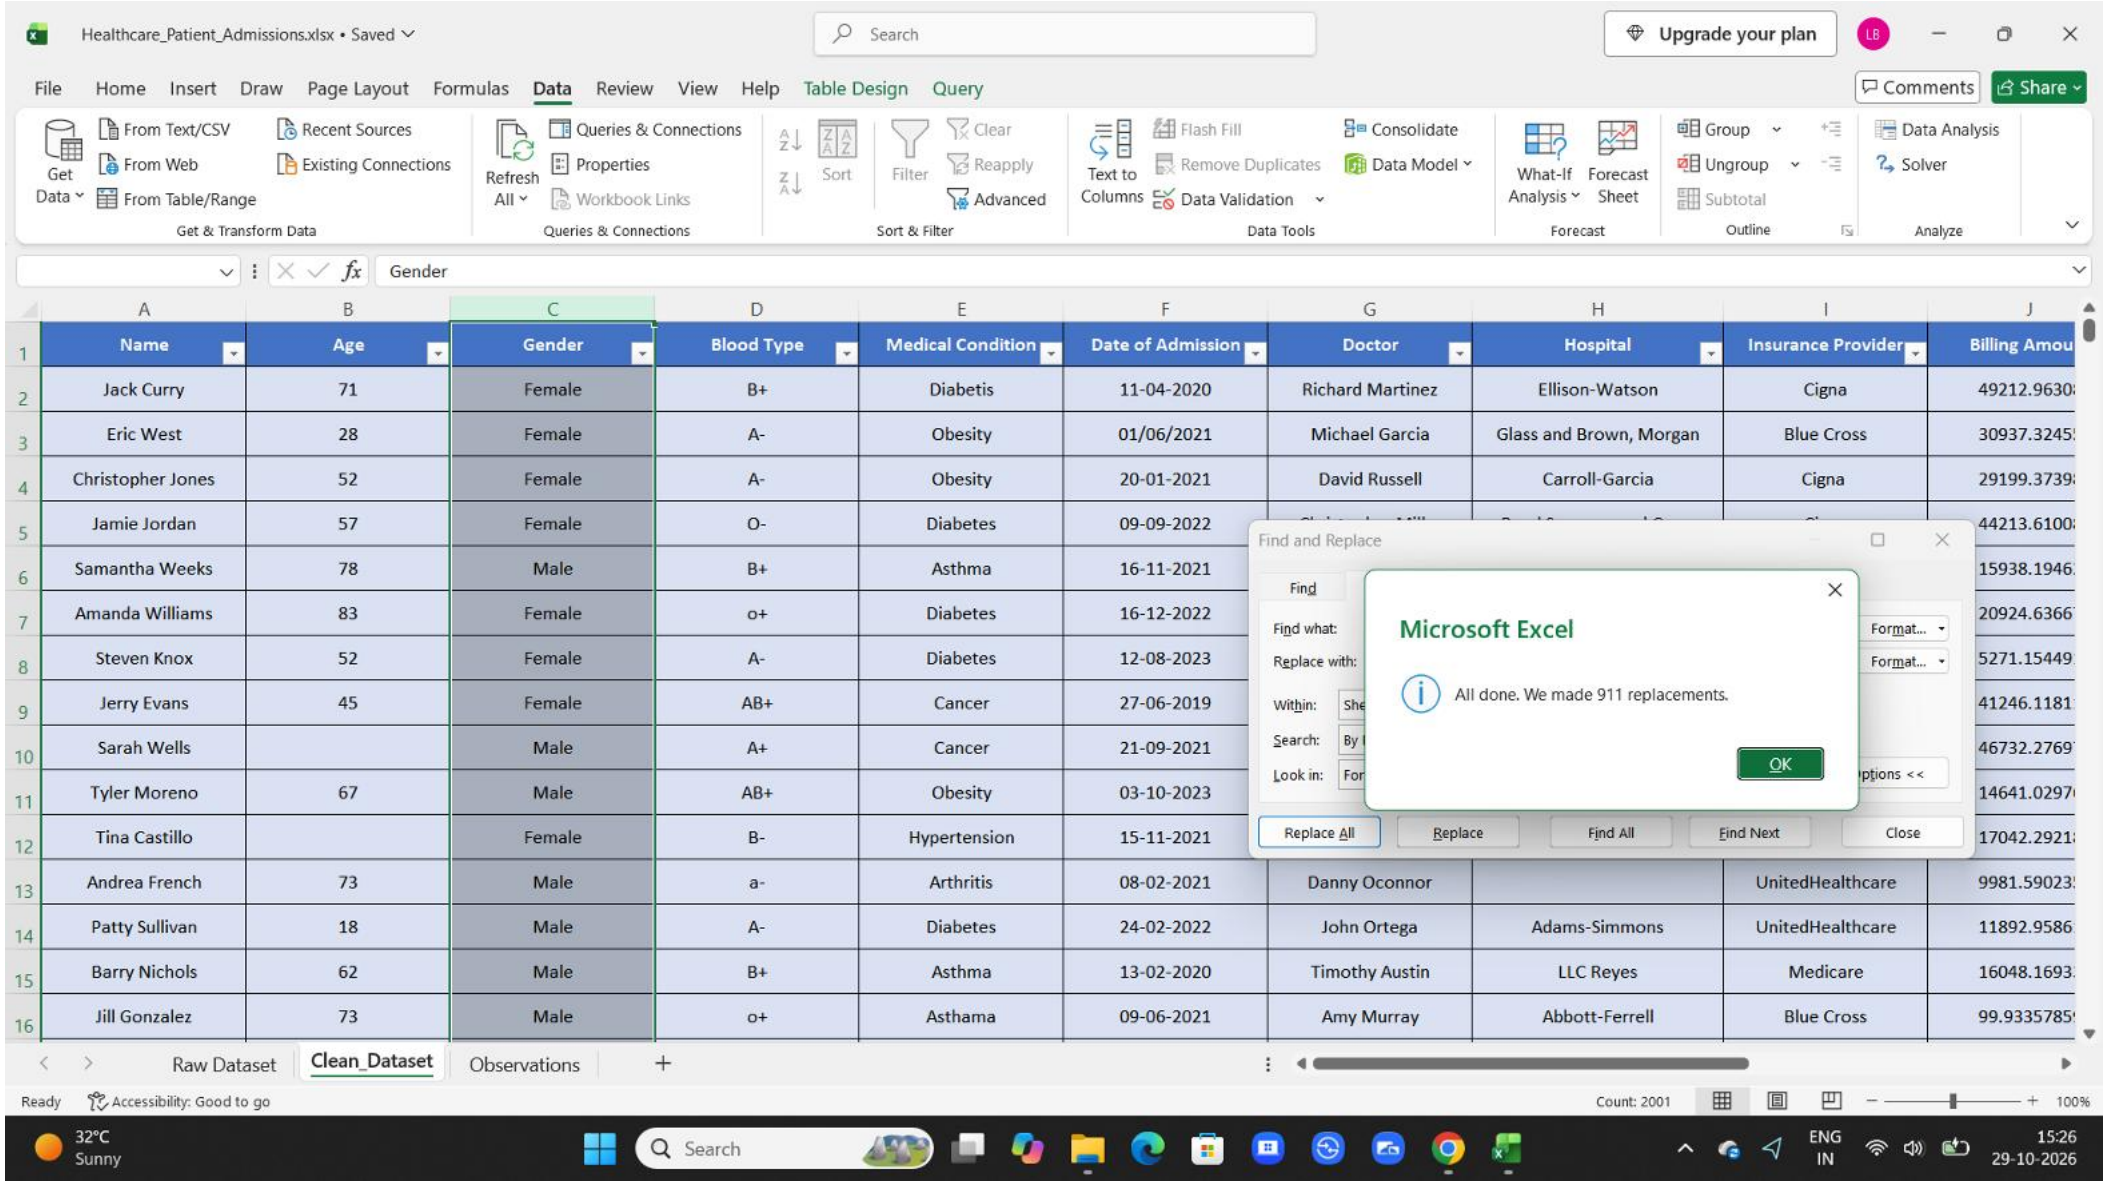

Observation: Used Find and Replace to find the exact cell value “female” and replace it with “Female”. The “Match entire cell contents” option was selected so the replacement targeted the whole cell value.

Name	Age	Gender	Blood Type	Medical Condition	Date of Admission	Doctor	Hospital	Insurance Provider	Billing Amou

Step 45 – Confirm the Female Value Replacement

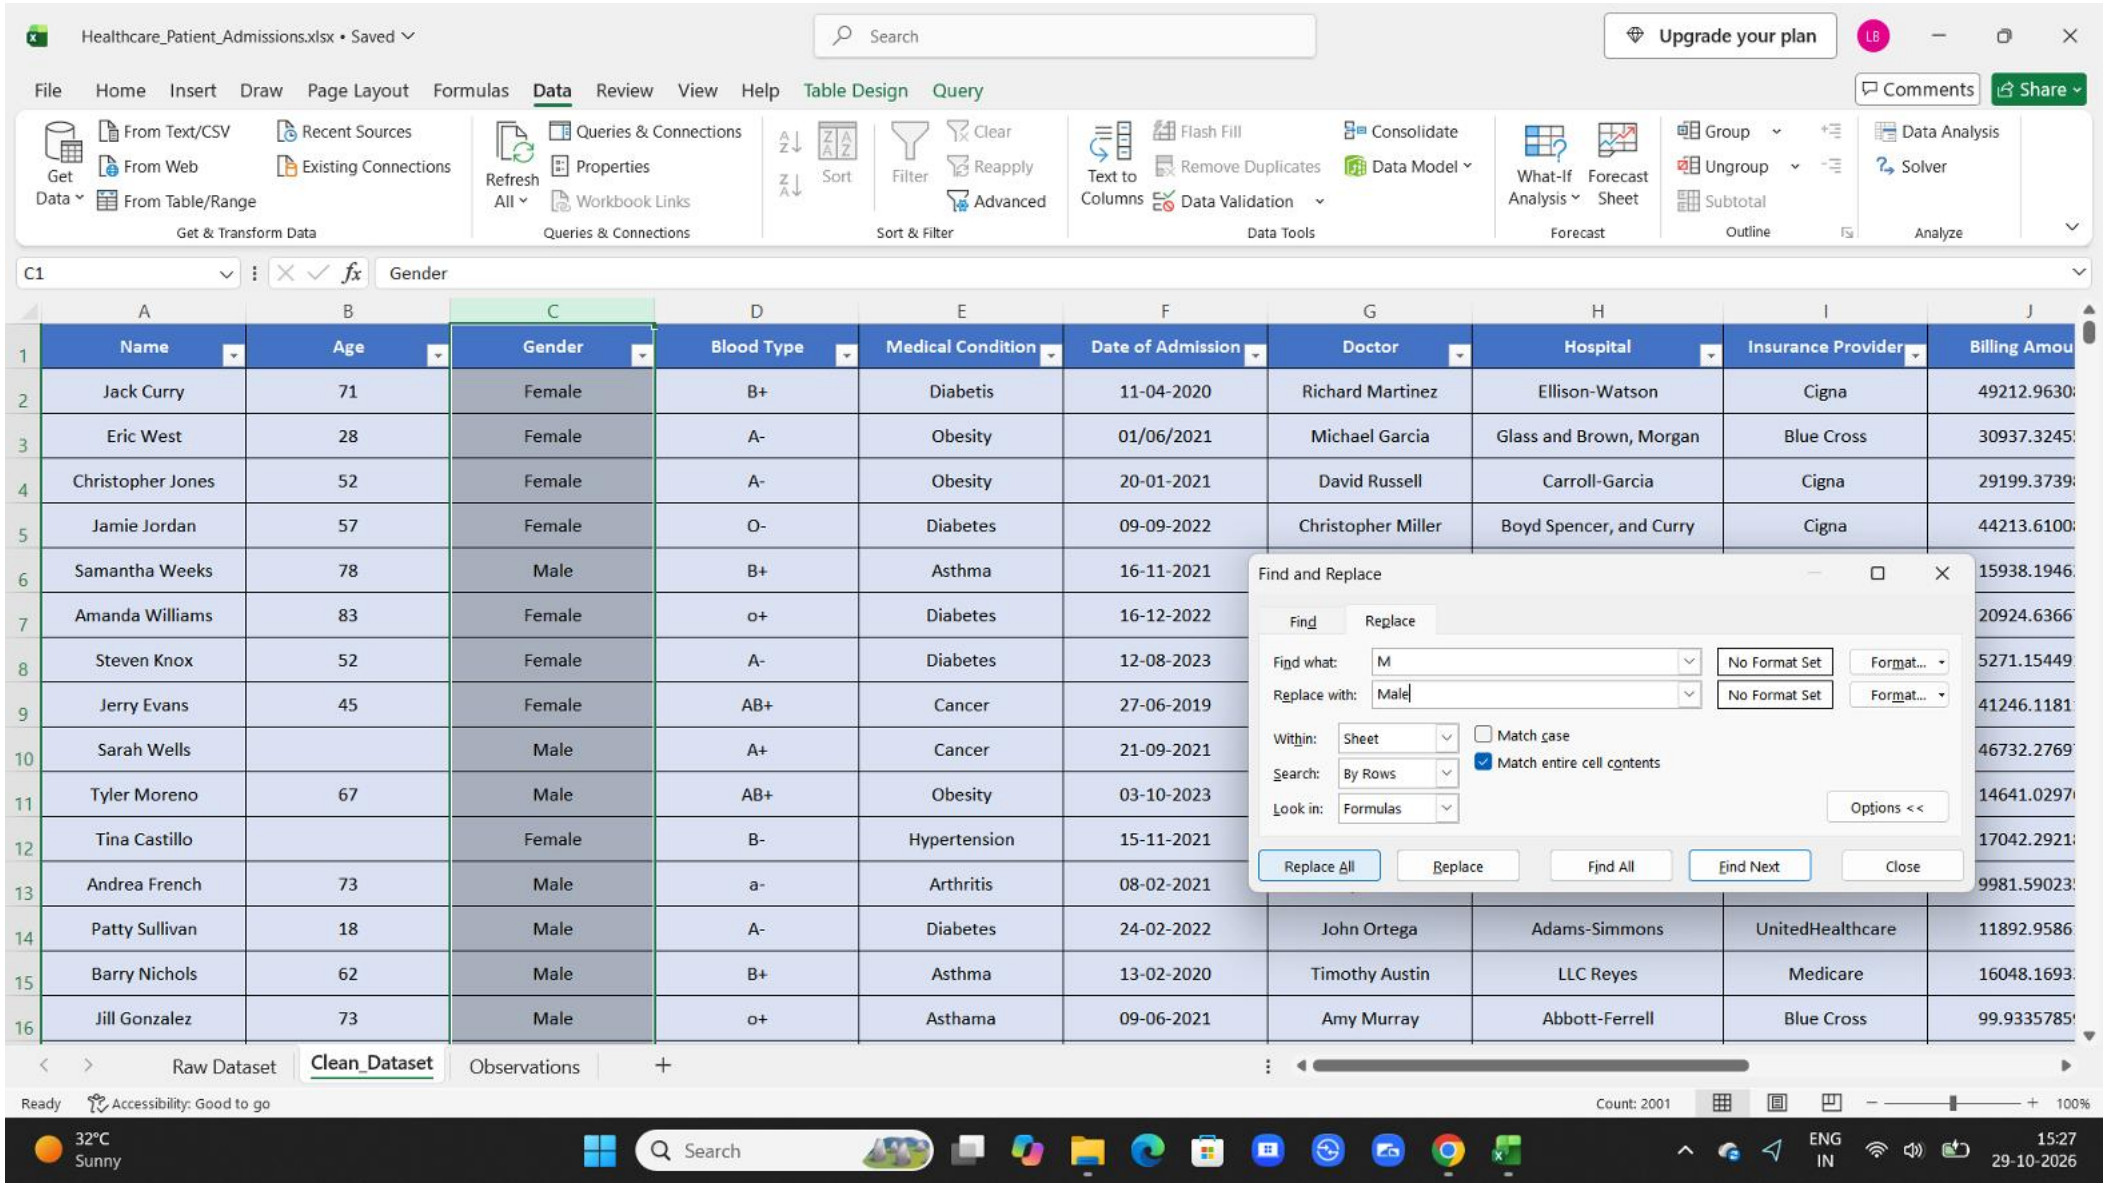

Observation: Excel reported “We made 911 replacements.” This indicates that 911 cells matching the search value were replaced with “Female”.

Name	Age	Gender	Blood Type	Medical Condition	Date of Admission	Doctor	Hospital	Insurance Provider	Billing Amou
Jack Curry	71	Female	B+	Diabetis	11-04-2020	Richard Martinez	Ellison-Watson	Cigna	49212.9630

Step 46 – Standardize Short Male Values

Observation: Used Find and Replace on the Gender column to find the exact cell value “M” and replace it with “Male”. The “Match entire cell contents” option was selected to target only cells containing that exact value.

Step 47 – Confirm the Male Value Replacement

Observation: Excel reported “We made 30 replacements.” This confirms that 30 cells containing the exact value “M” were changed to “Male”.

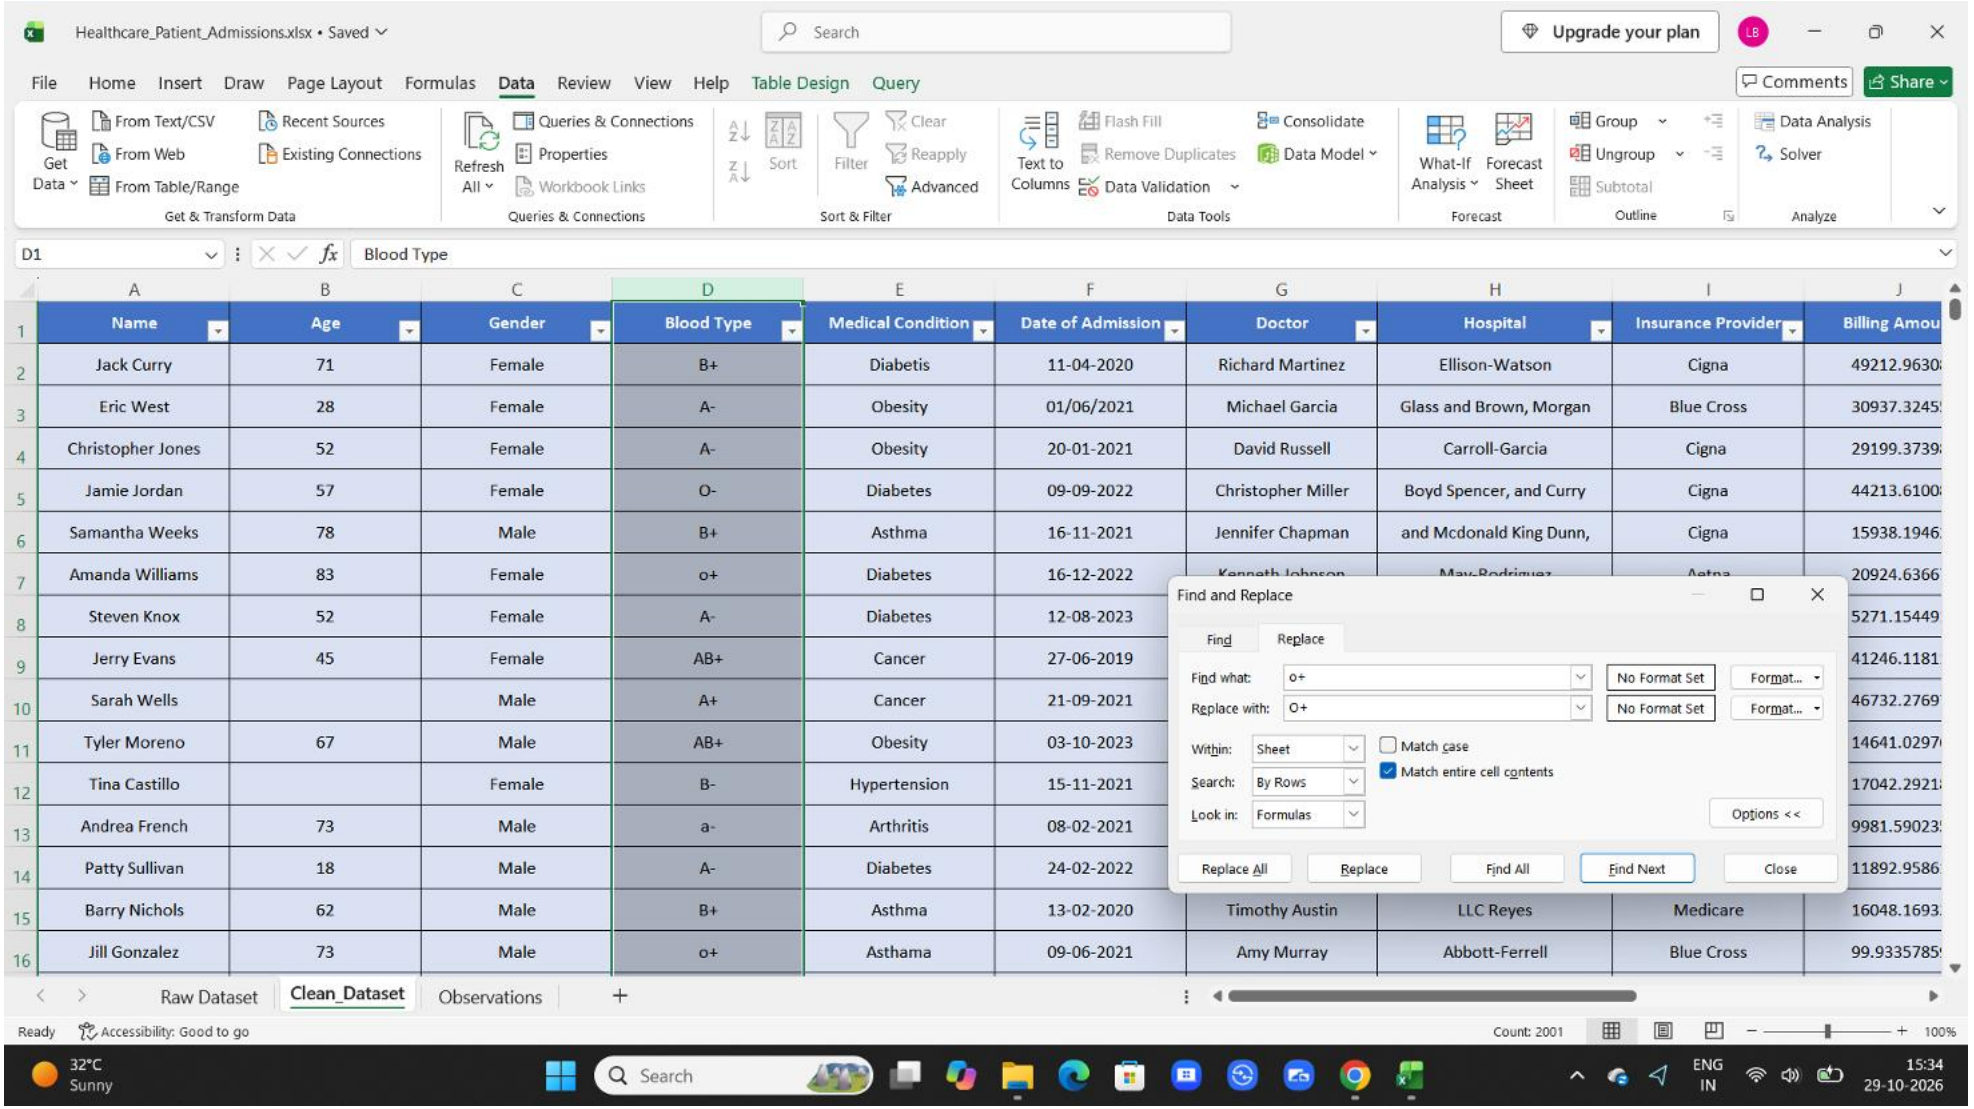

Name	Age	Gender	Blood Type	Medical Condition	Date of Admission	Doctor	Hospital	Insurance Provider	Billing Amou

STEP 48

Standardize Blood Type Values Using Find and Replace

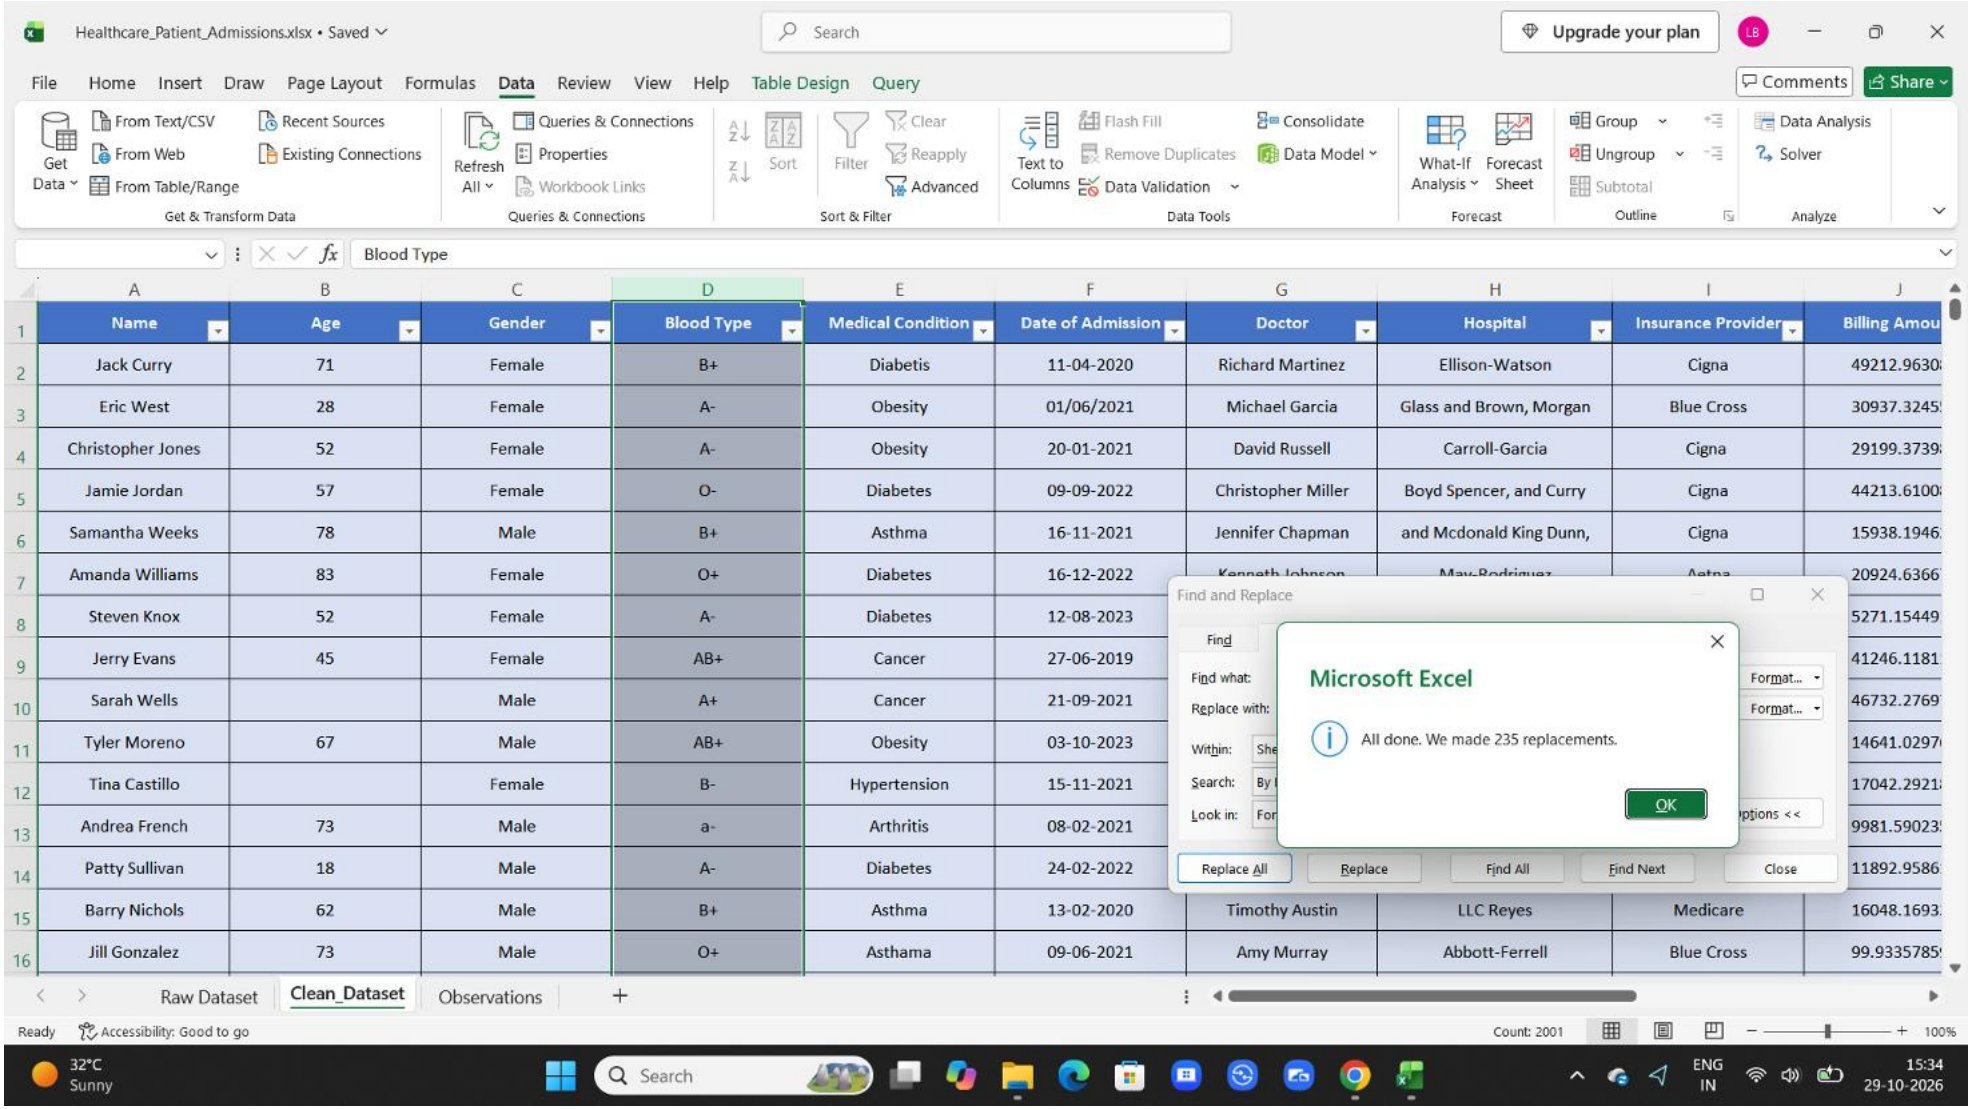

Observation: Opened Find and Replace for the Blood Type column and entered the value shown in the dialog. This step is intended to standardize matching blood-type entries. Check that the search and replacement values are different as intended before using Replace All.

STEP 49

Confirm Blood Type Replacement

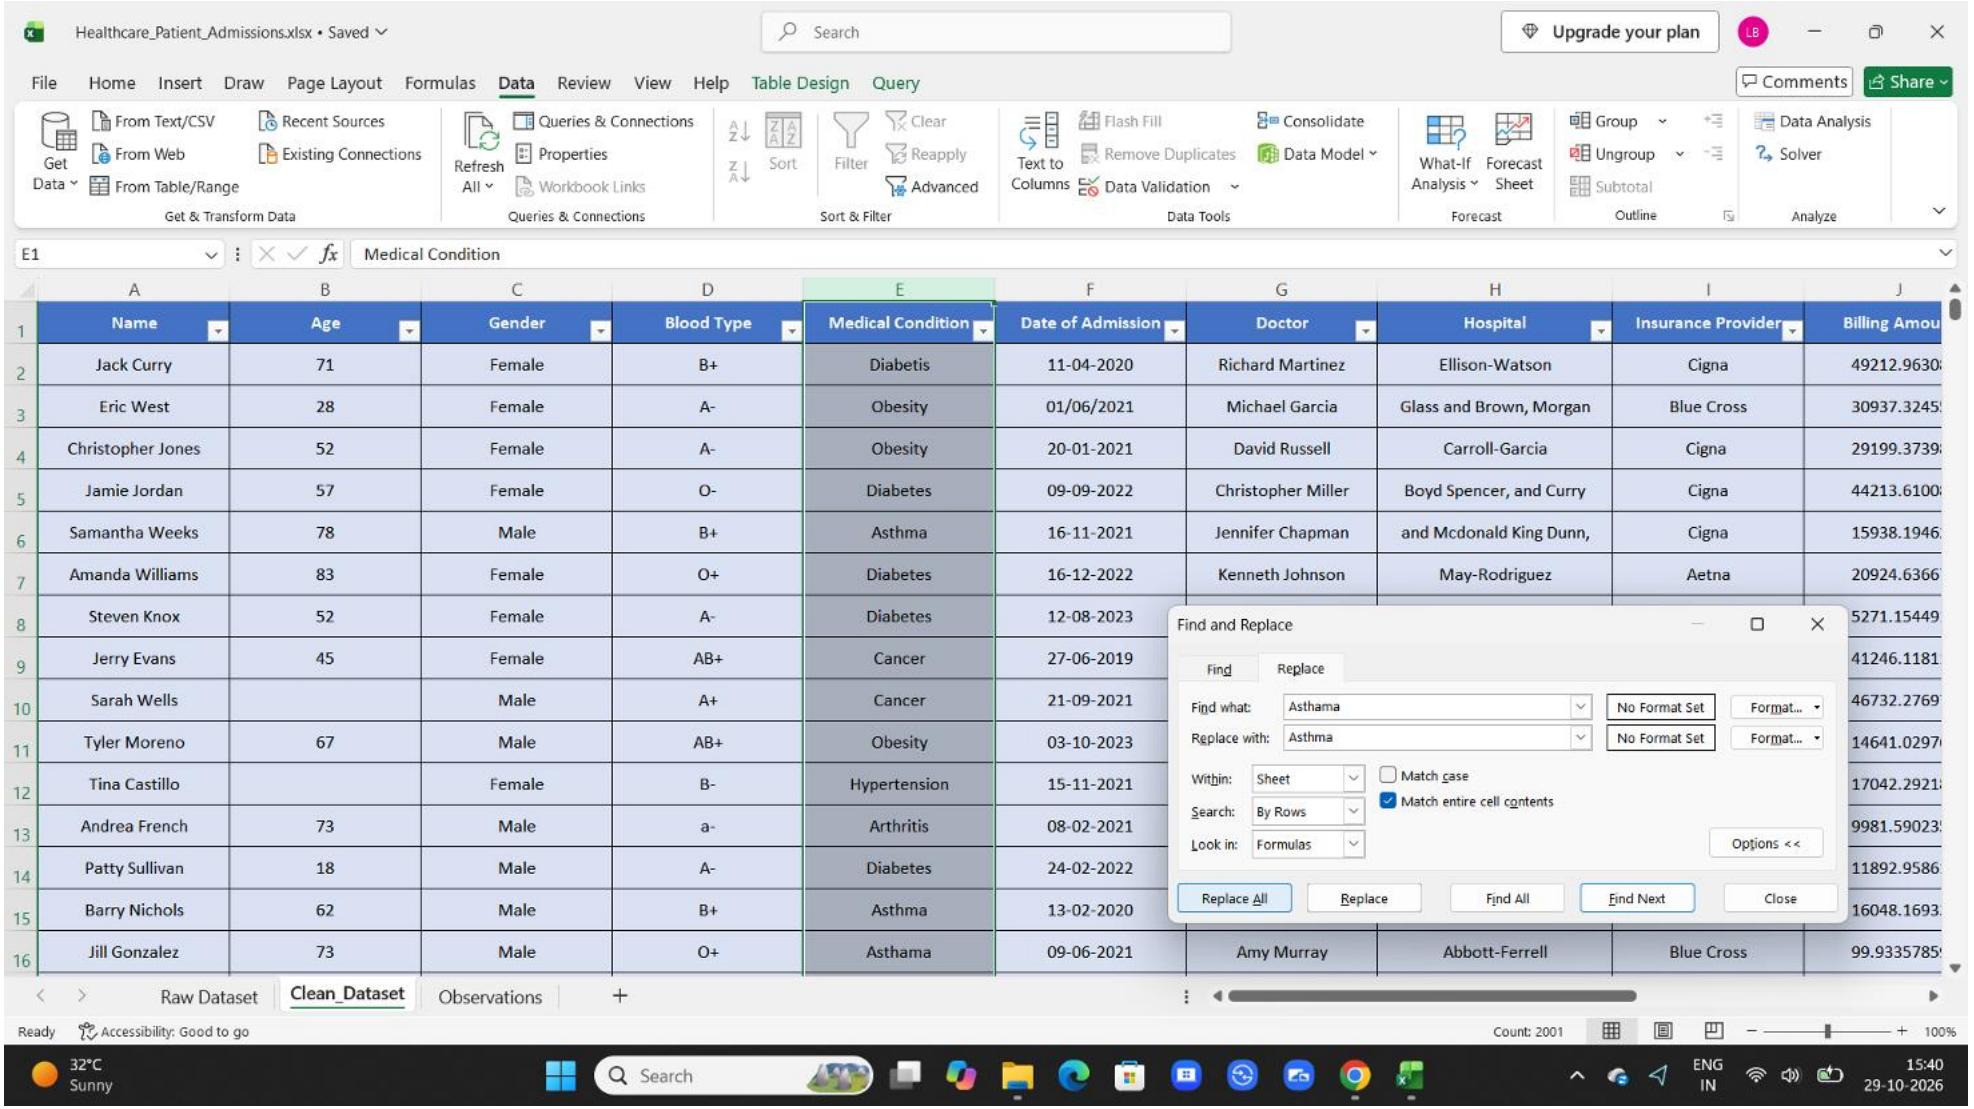

Observation: Excel displayed a message reporting 235 replacements. This records the result reported by Excel; verify the selected search and replacement values to ensure the changes represent the intended standardization.

STEP 50

Standardize Medical Condition Text

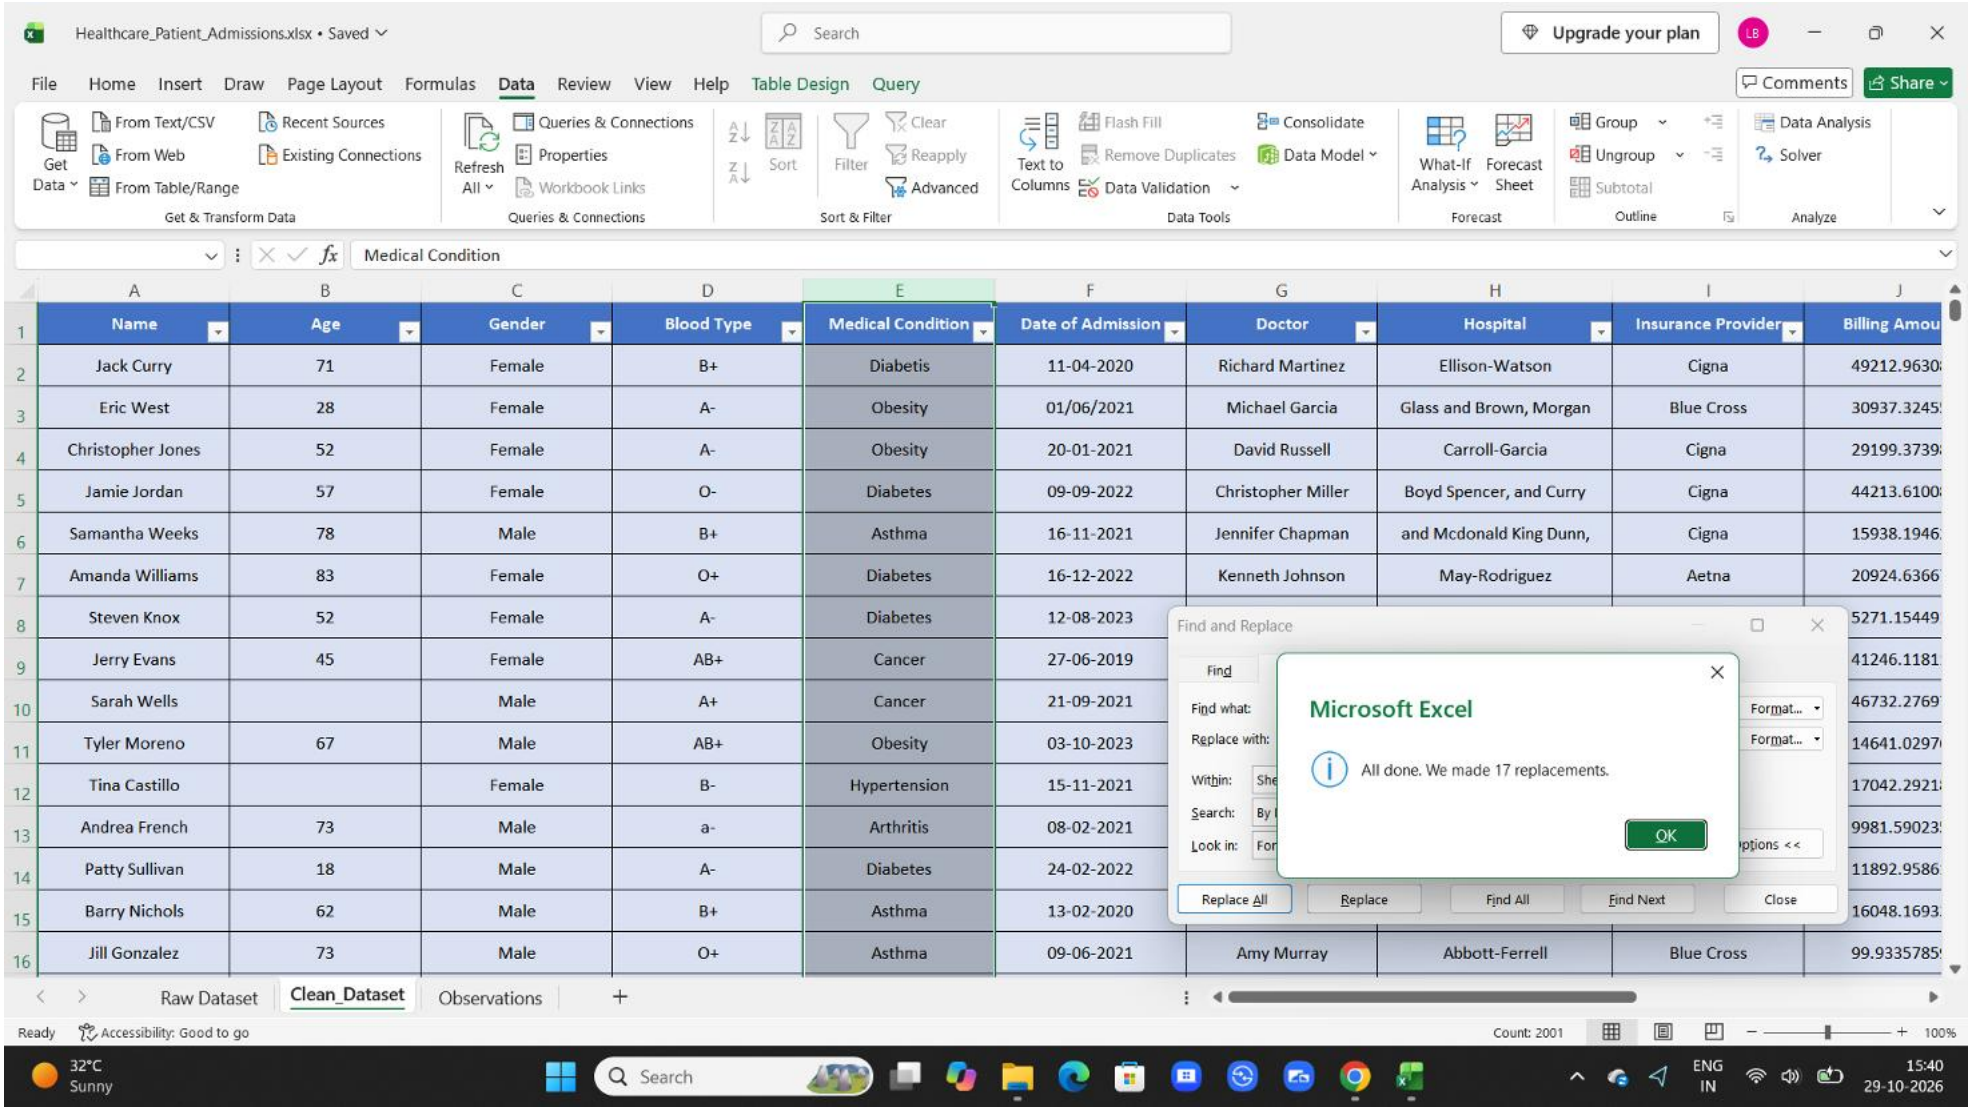

Observation: Opened Find and Replace for the Medical Condition column to standardize the displayed condition label. Use the correct spelling consistently throughout the column and confirm the replacement text before applying Replace All.

STEP 51

Confirm Medical Condition Replacement

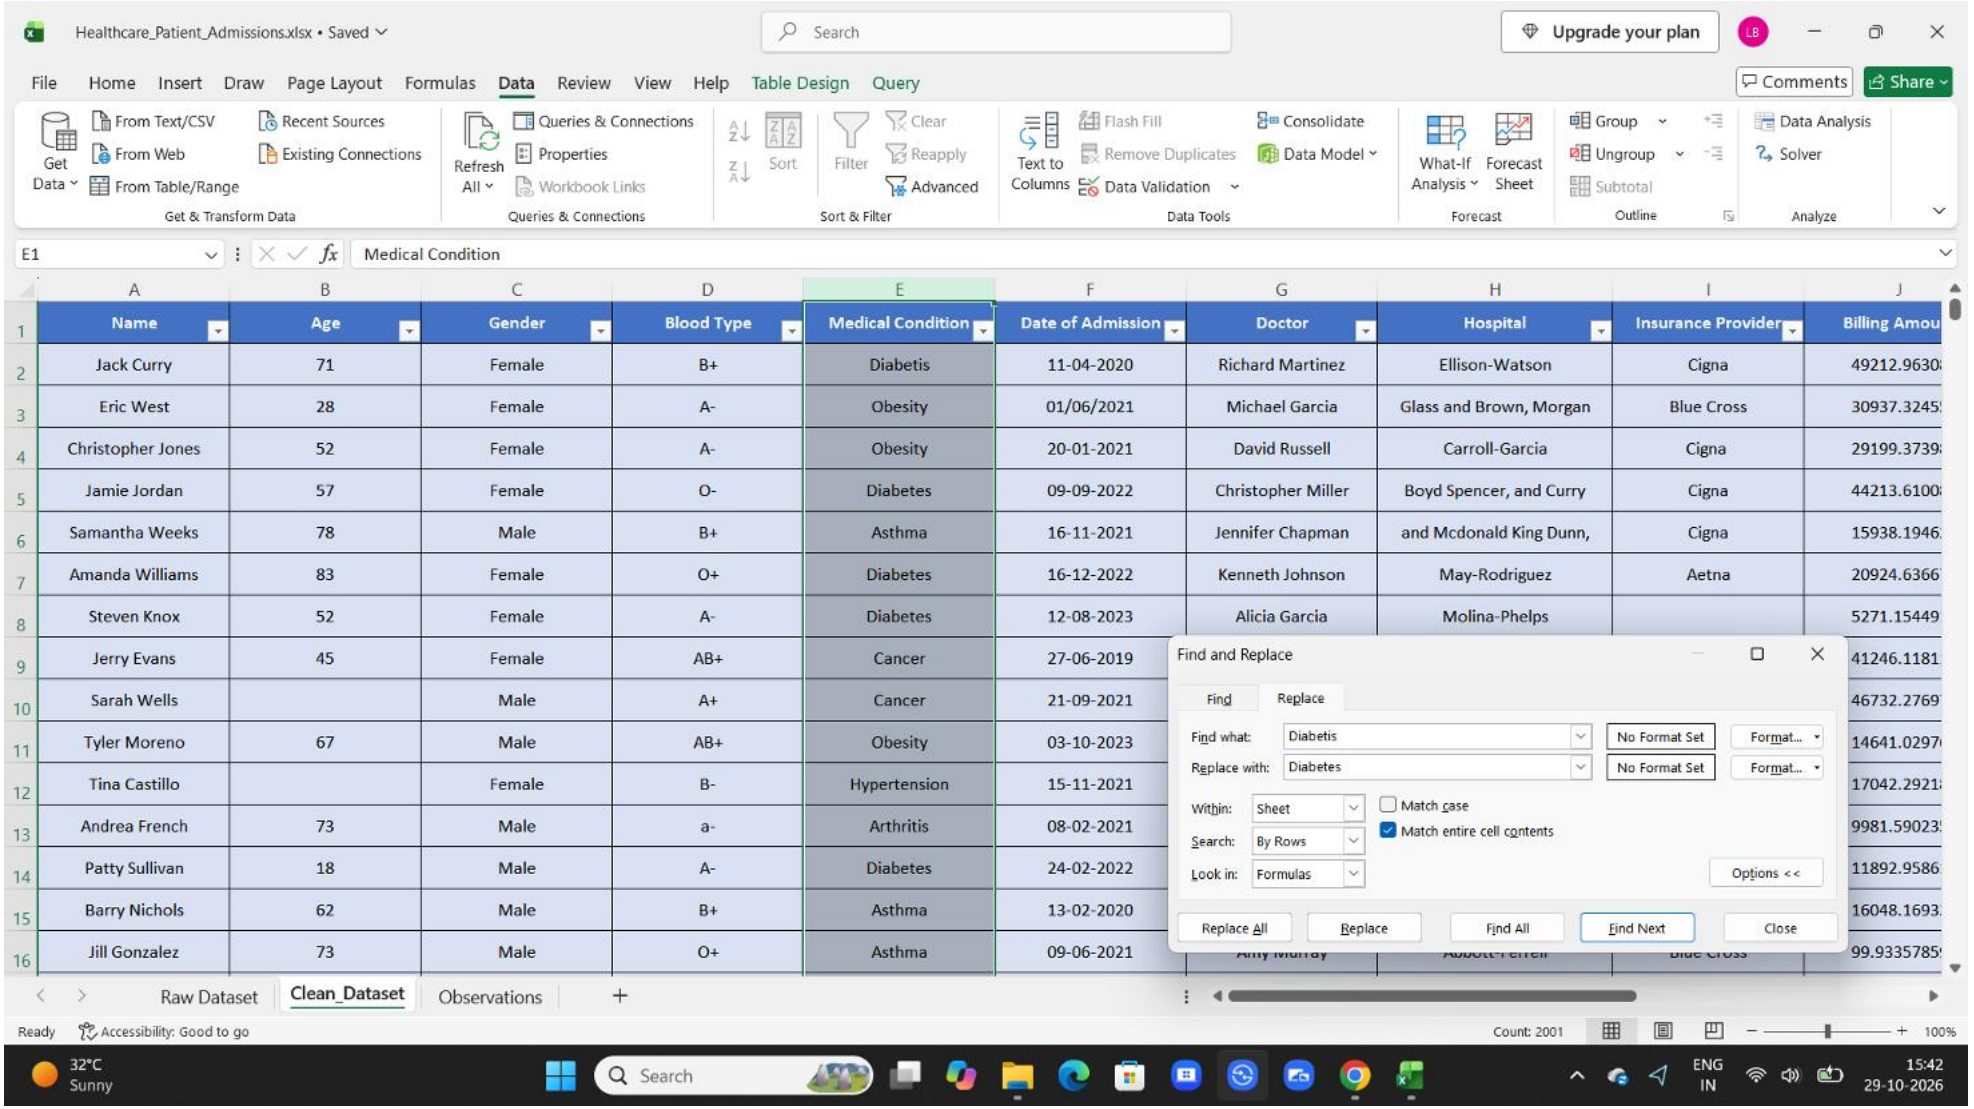

Observation: Excel displayed a message reporting 17 replacements. The result indicates that Excel replaced 17 matching entries according to the Find and Replace settings.

STEP 52

Standardize Diabetes Entries

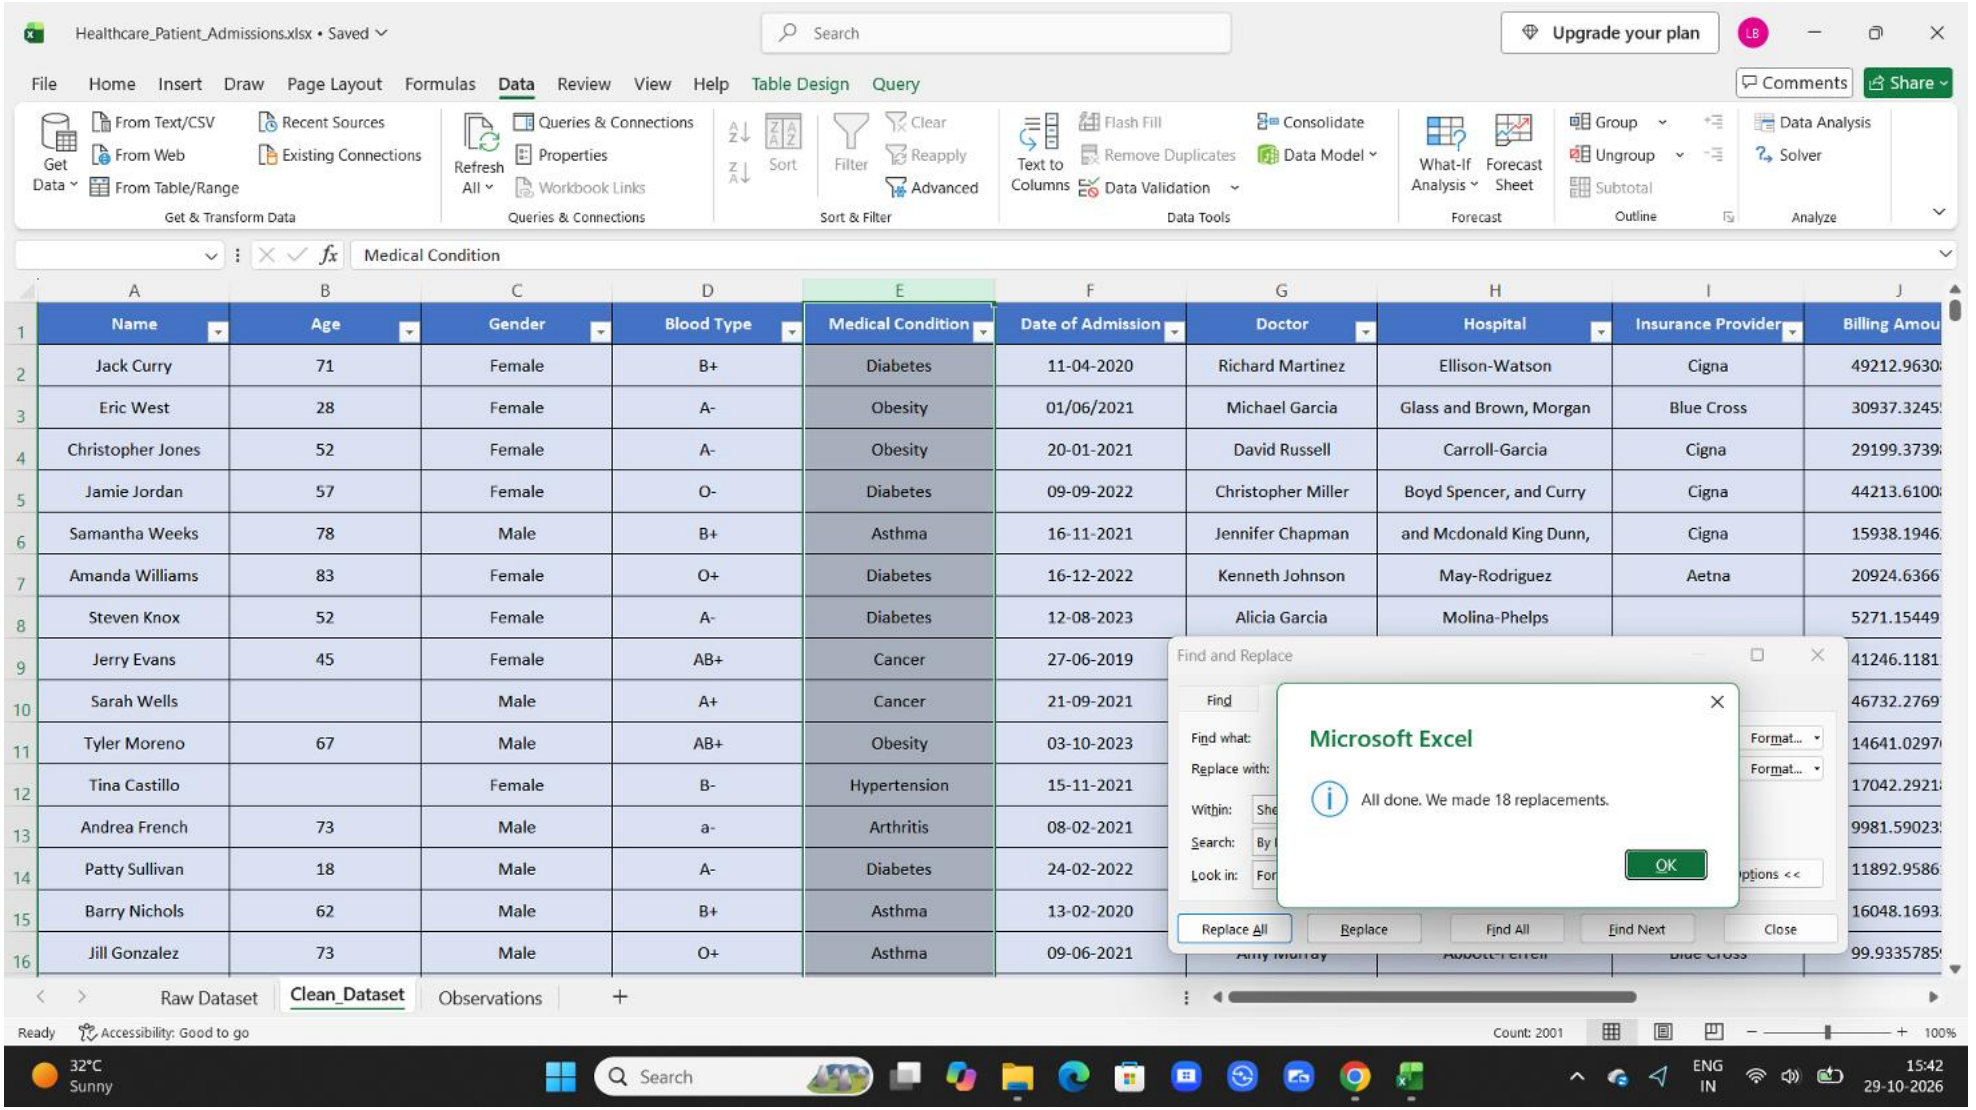

Observation: Opened Find and Replace for the Medical Condition column to standardize the diabetes label. Ensure the search text is the inconsistent spelling and the replacement text is the correct spelling before applying Replace All.

STEP 53

Confirm Diabetes Replacement

Observation: Excel displayed a message reporting 18 replacements. The result indicates that Excel replaced 18 matching entries according to the Find and Replace settings.

Step 54: Apply Date Validation Check

Observation:

Added a Date Validation column using an IF formula to check the Discharge Date against the Date of Admission. The formula labels missing discharge dates as “Check Missing Date”, dates earlier than the admission date as “Check Date Order”, and records that pass both checks as “Valid”. The visible examples show all three results.

Step 55: Correct Doctor Names Using ChatGPT for Excel

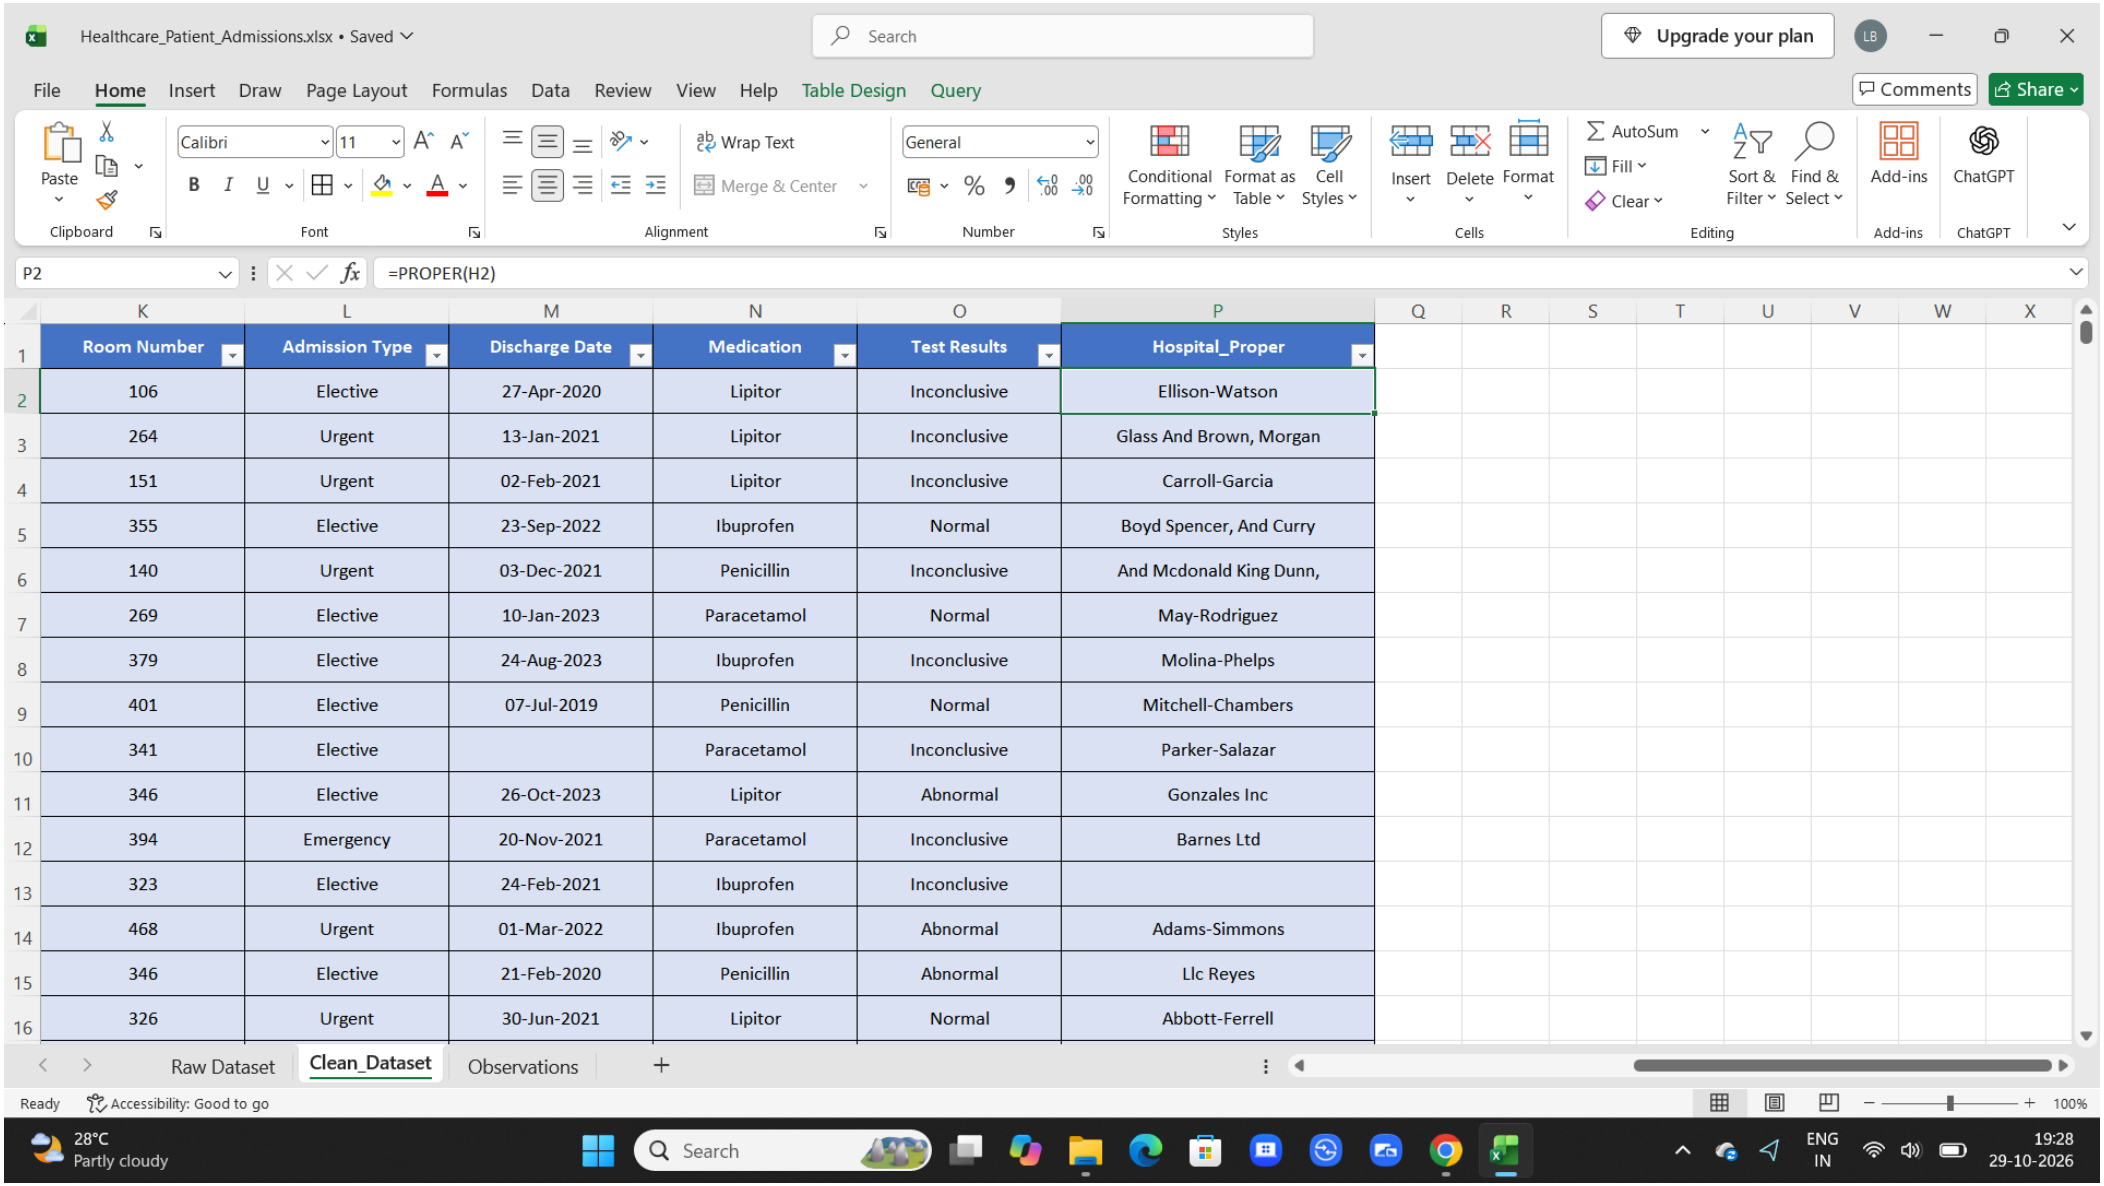

Observation:

Used ChatGPT for Excel to apply the approved corrections to the Doctor column (column G) in Clean_Dataset, for the range G13:G1915. The on-screen confirmation reports that 38 corrections were applied, 0 rows were skipped, and all 38 proposed values were present during final verification.

Step 56 – Standardize Hospital Names Using the PROPER Function

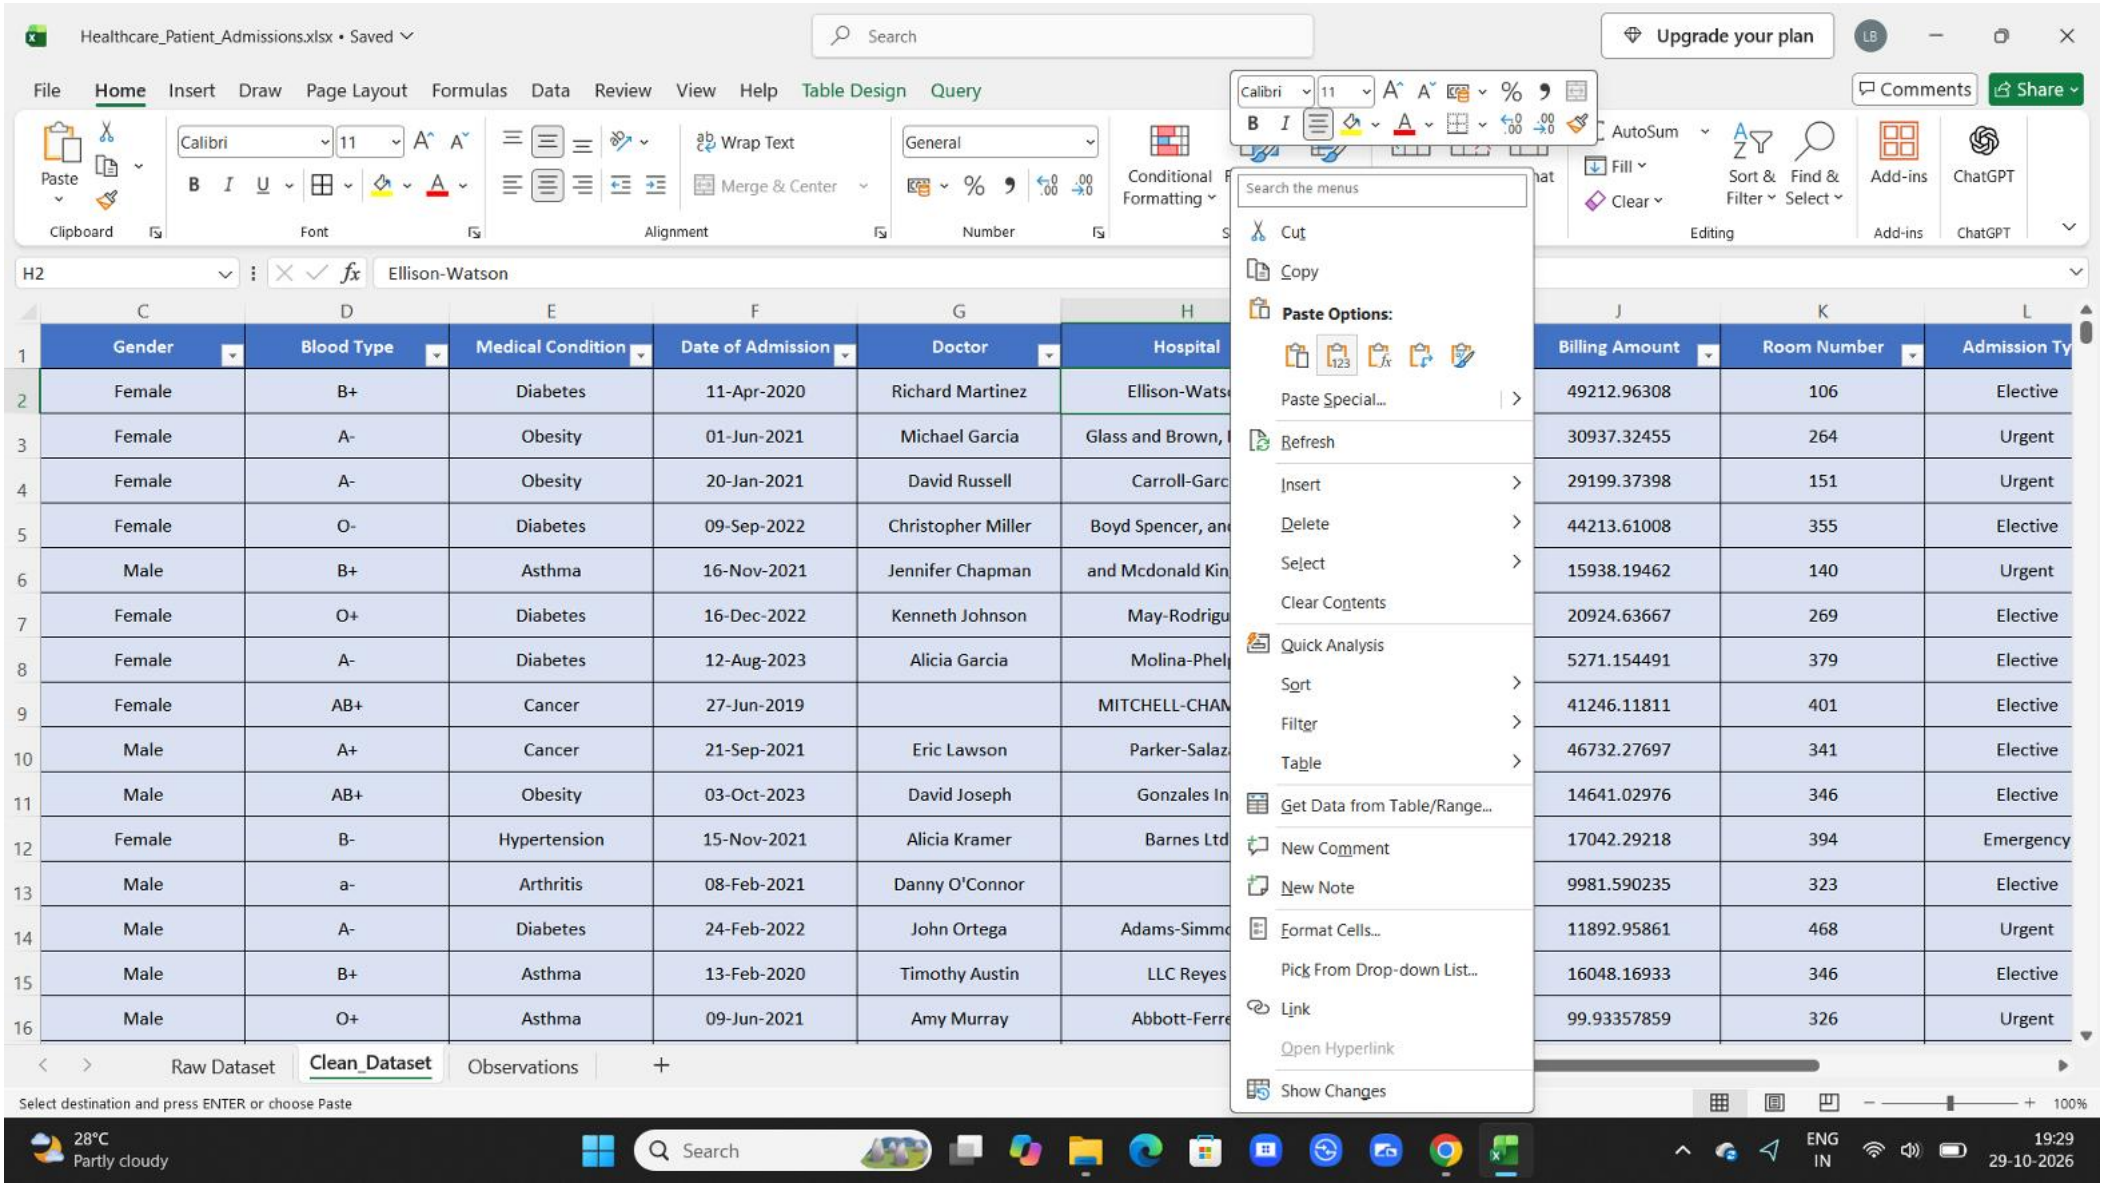

Observation: Added a helper column named **Hospital_Proper** and used **=PROPER(H2)** to convert hospital names to consistent title case. The formula references the original Hospital column and displays the standardized name in the helper column.

Room Number	Admission Type	Discharge Date	Medication	Test Results	Hospital_Proper

Step 57 – Copy the Standardized Hospital Names

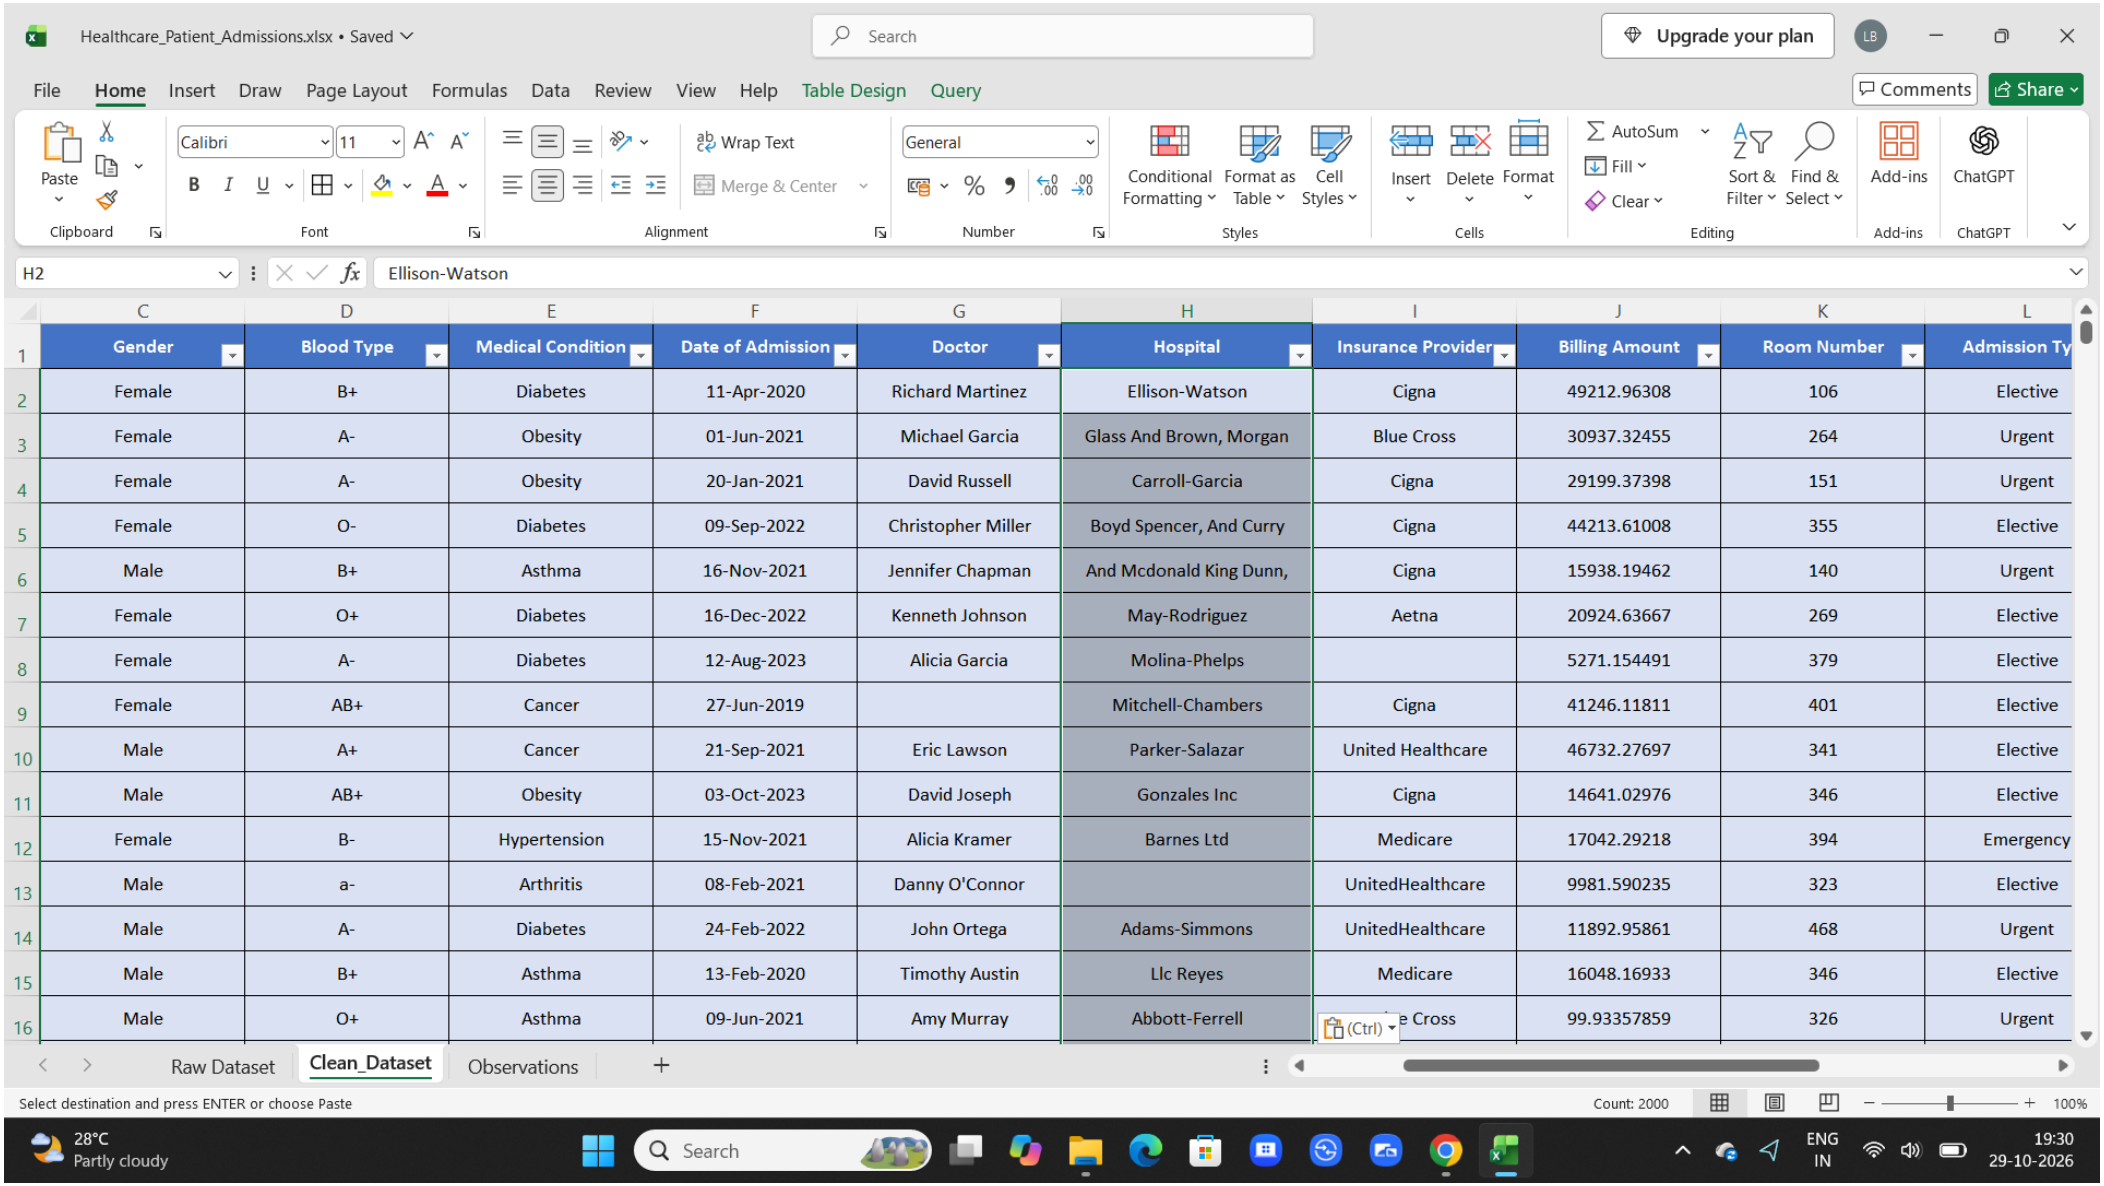

Observation: Selected the original **Hospital** column and prepared to replace its inconsistent text with the standardized results from **Hospital_Proper**. The screenshot shows the column context menu during the copy/paste process.

Step 64: Change Billing Amount Format to Number

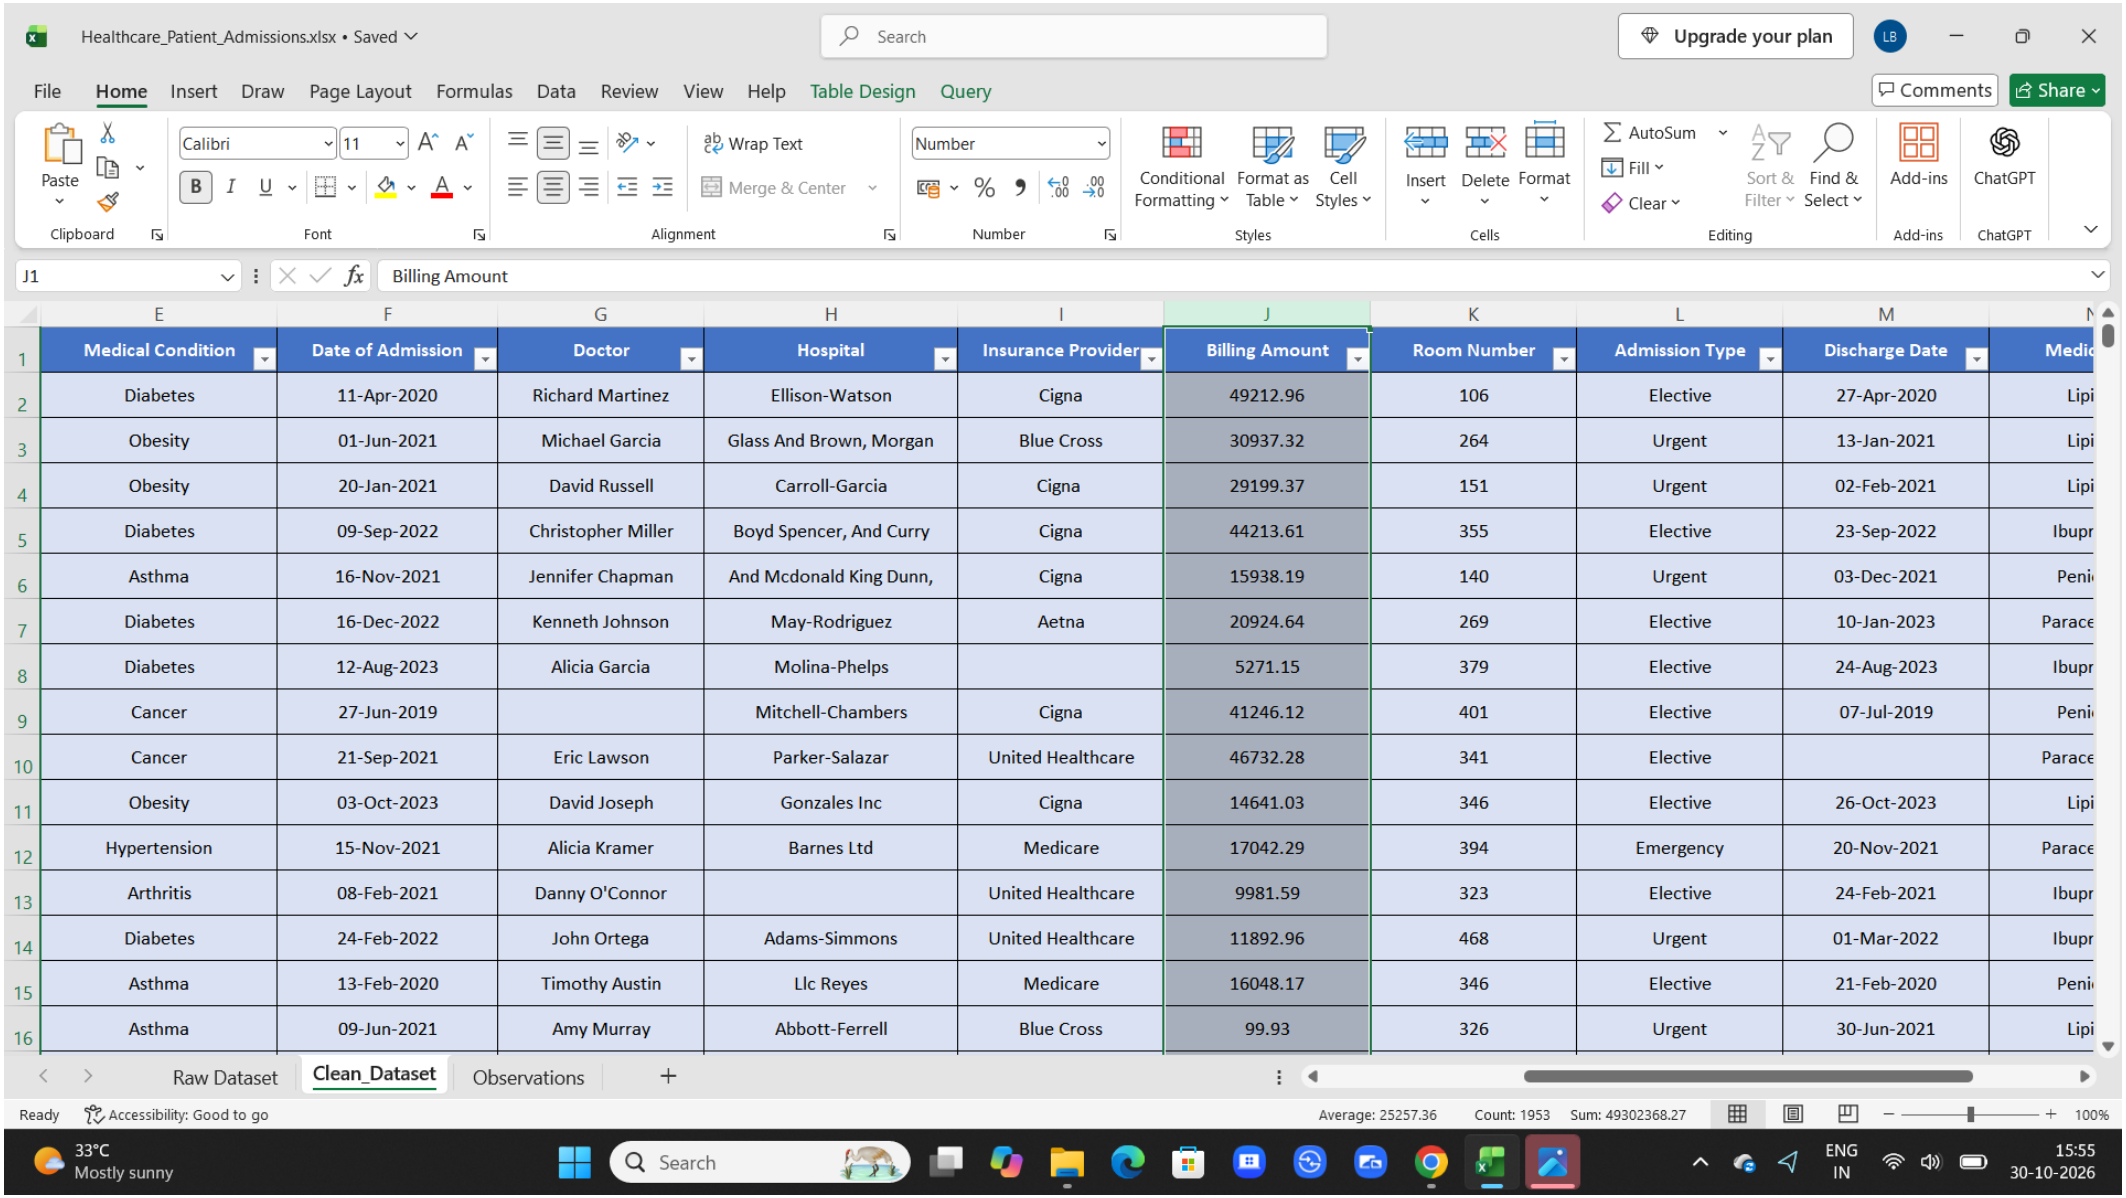

Observation: Selected the Billing Amount column and opened the Number Format menu. Changed the format from General to Number so the billing values are displayed in a consistent numeric format.

Step 65: Verify Billing Amount Number Format

Observation: Checked the Billing Amount column after applying the Number format. The values are displayed with two decimal places (for example, 49212.96), making the amounts easier to read and compare. This changes the display format; it does not necessarily round or change the underlying stored values.

Step 66: Change the Room Number Column Format to Number

Observation:

Selected the Room Number column and opened Excel's Number Format menu. Changed the cell format from General to Number so the room-number values are treated as numeric values for consistent data formatting.

Step 73 – Confirm Admission Type replacements

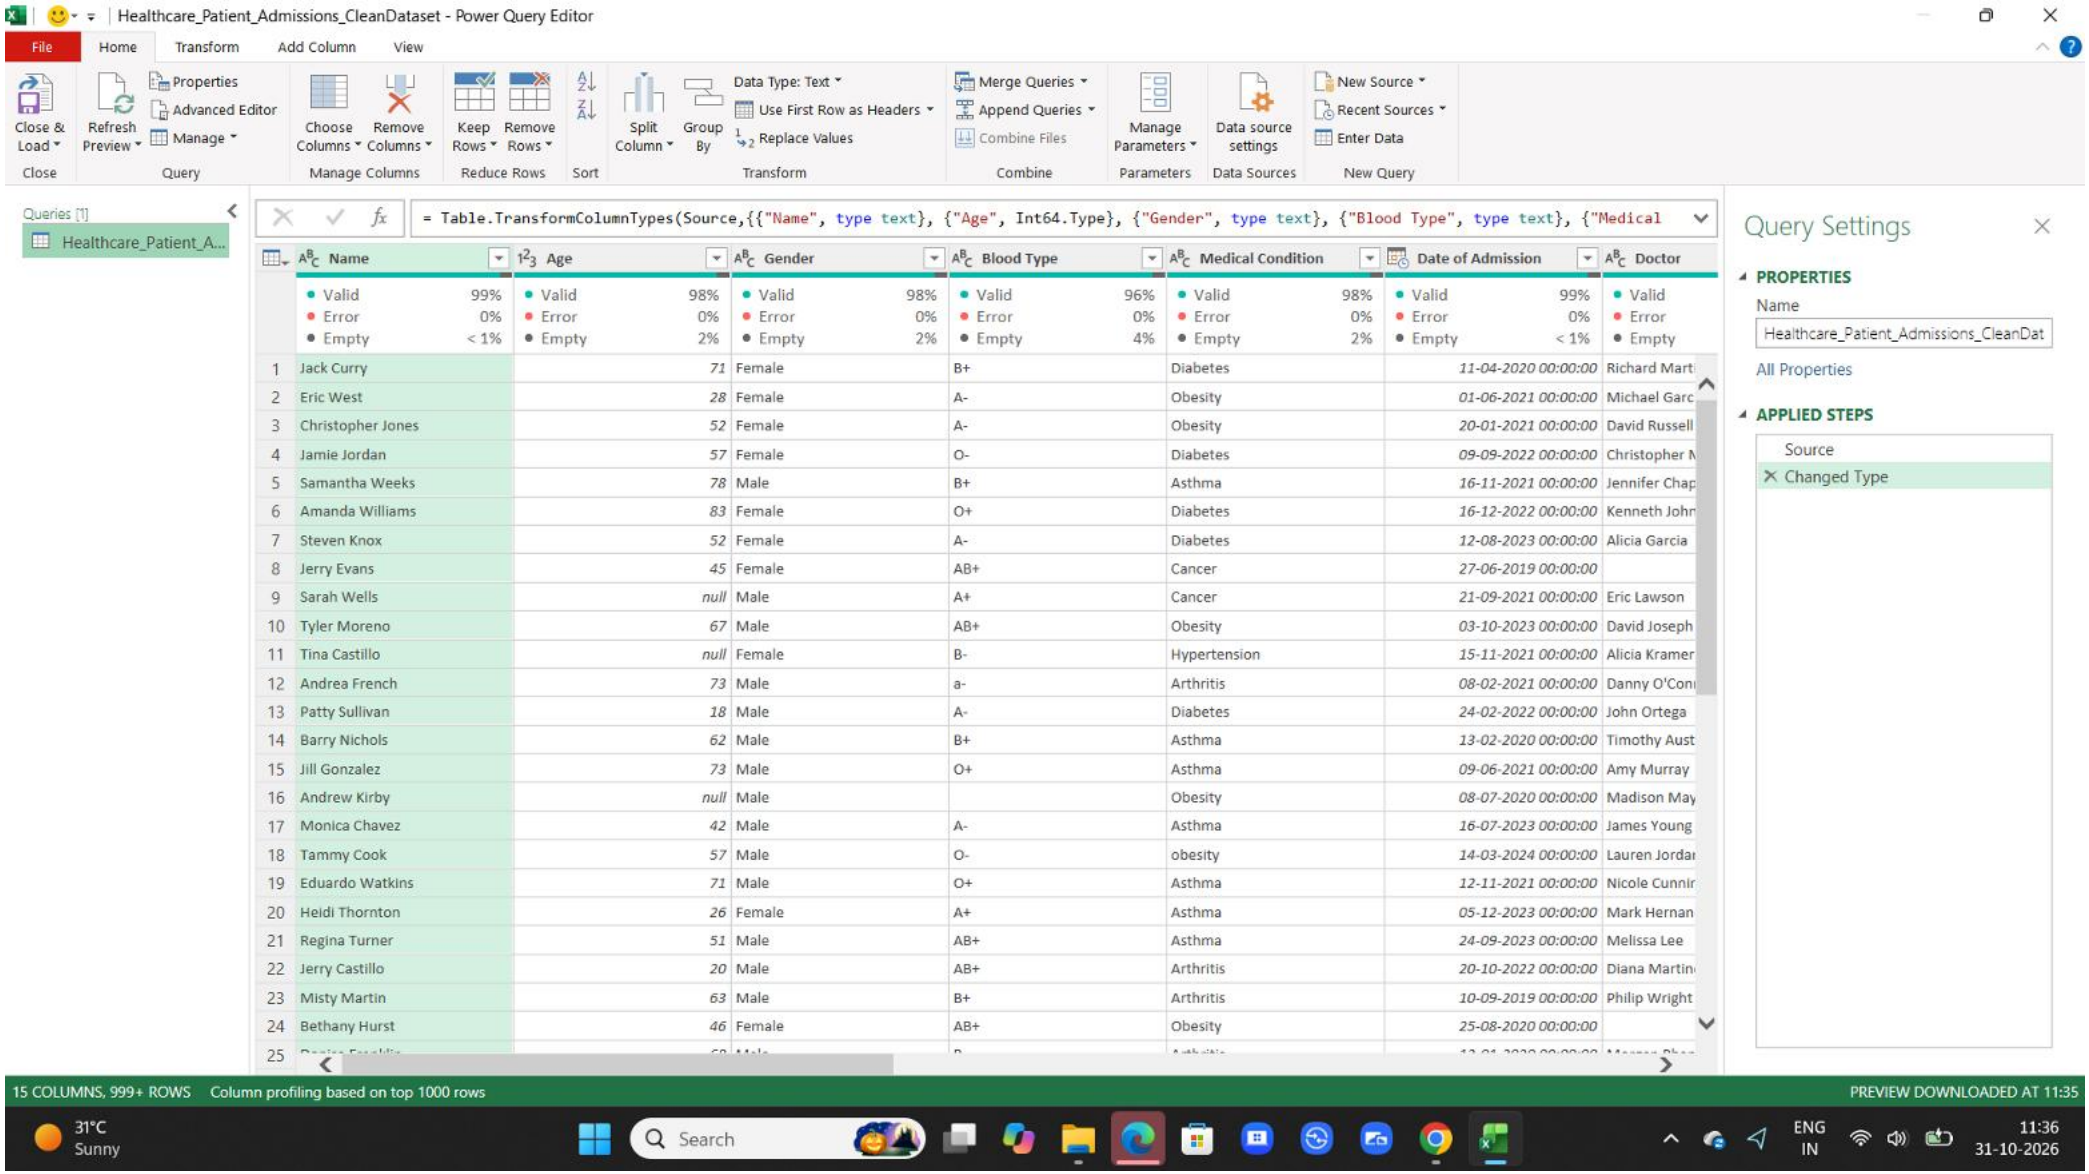

Observation: Excel displayed the confirmation message, “We made 654 replacements,” after using Find and Replace. This confirms that 654 matching entries were replaced with the standardized Admission Type text. The screenshot shows the replacement result; it does not indicate any rows were deleted.

Doctor	Hospital	Insurance Provider	Billing Amount	Room Number	Admission Type	Discharge Date	Medication	Test Results

Step 74 – Open Power Query and review column quality

Observation: Opened the Healthcare Patient Admissions query in Power Query Editor and reviewed the dataset structure. The preview shows 15 columns and 999+ rows, with Valid, Error, and Empty indicators for the columns. This review helps identify data-quality issues and check the existing column data types before further transformations.

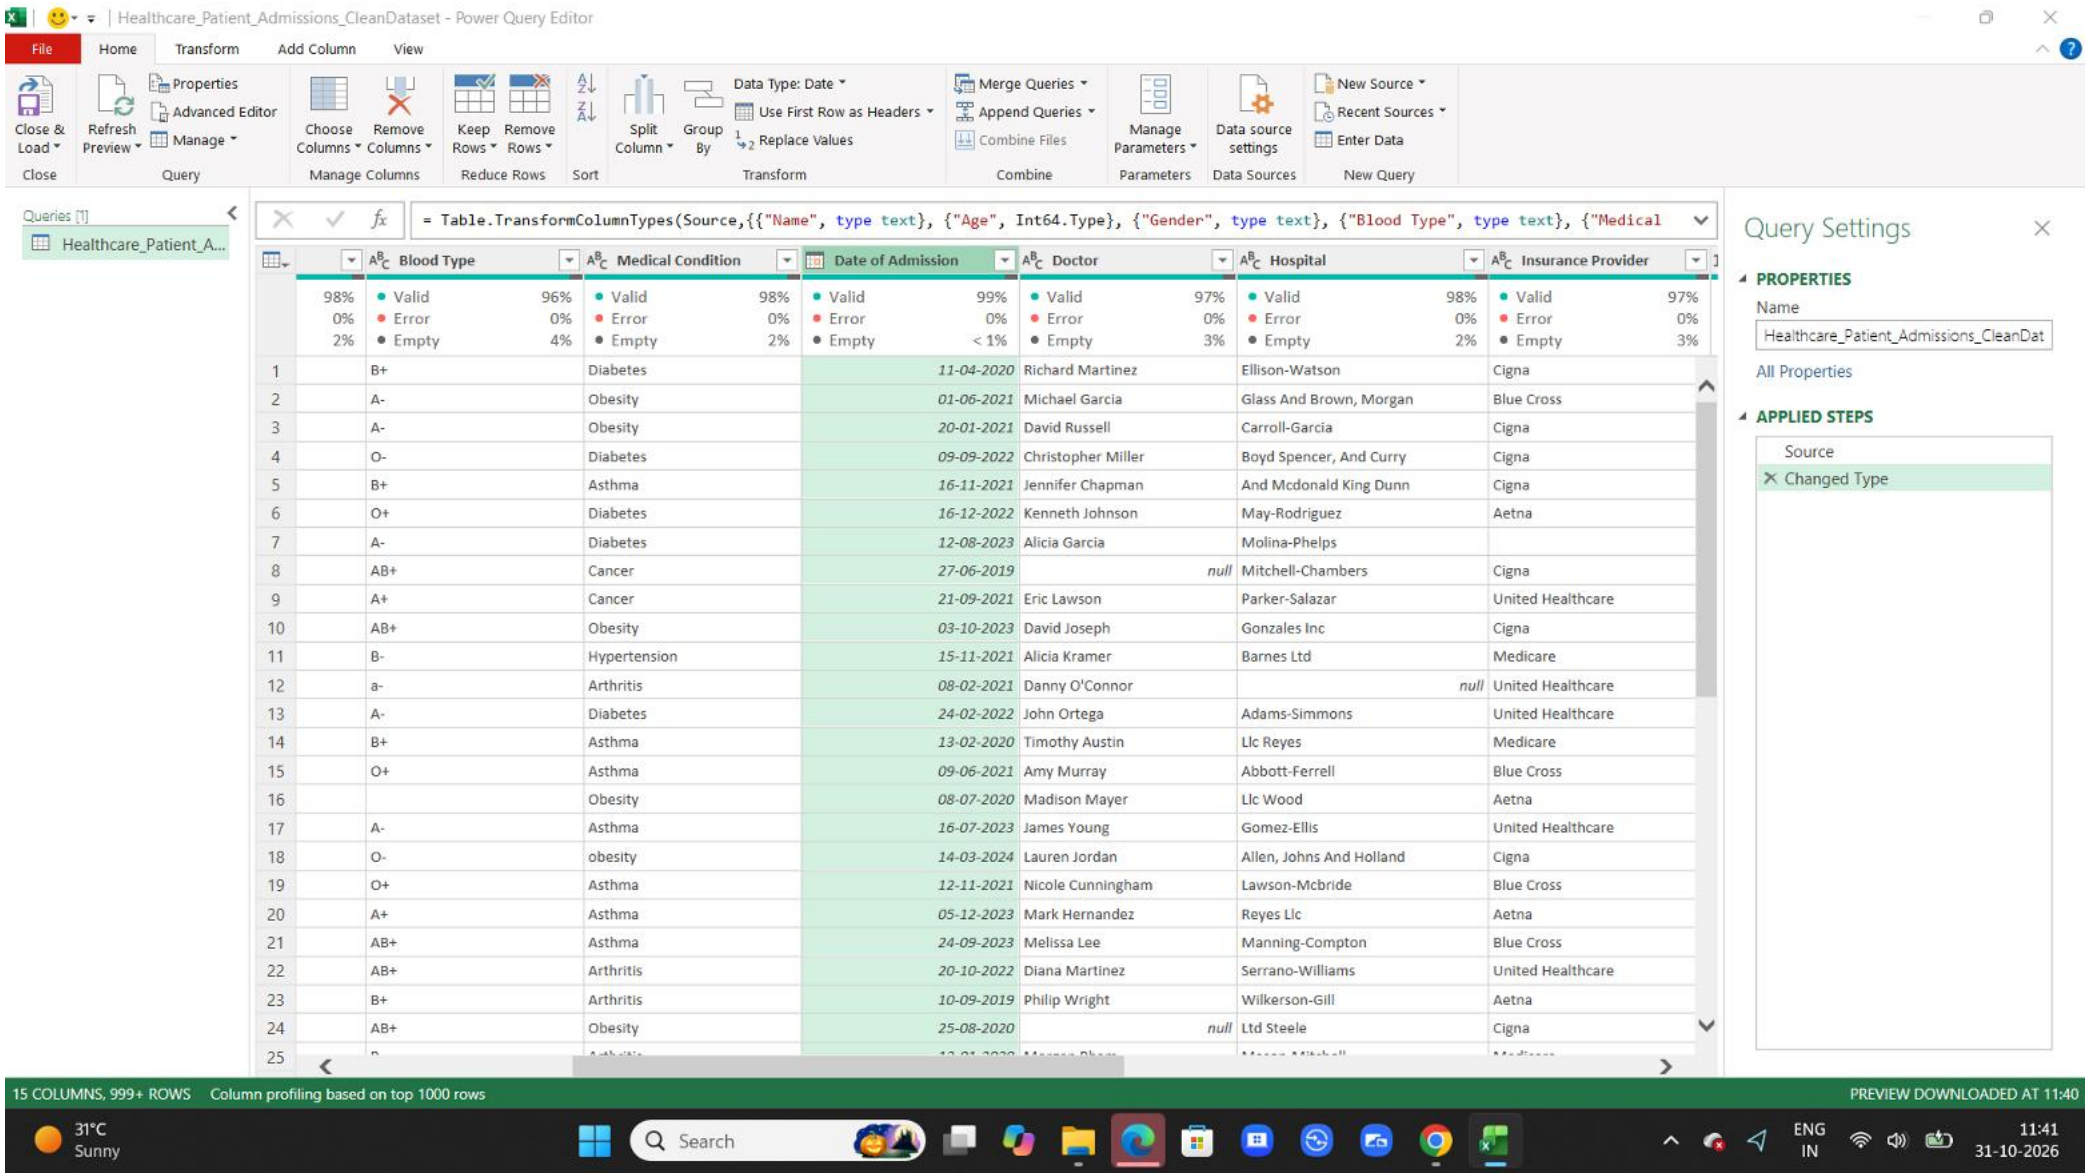

Step 75 – Change Date of Admission data type to Date

Observation: Selected the Date of Admission column and opened the Data Type menu. Changed its data type from Date/Time to Date so the column stores the admission date without a time component.

Step 76 – Verify Date of Admission as Date

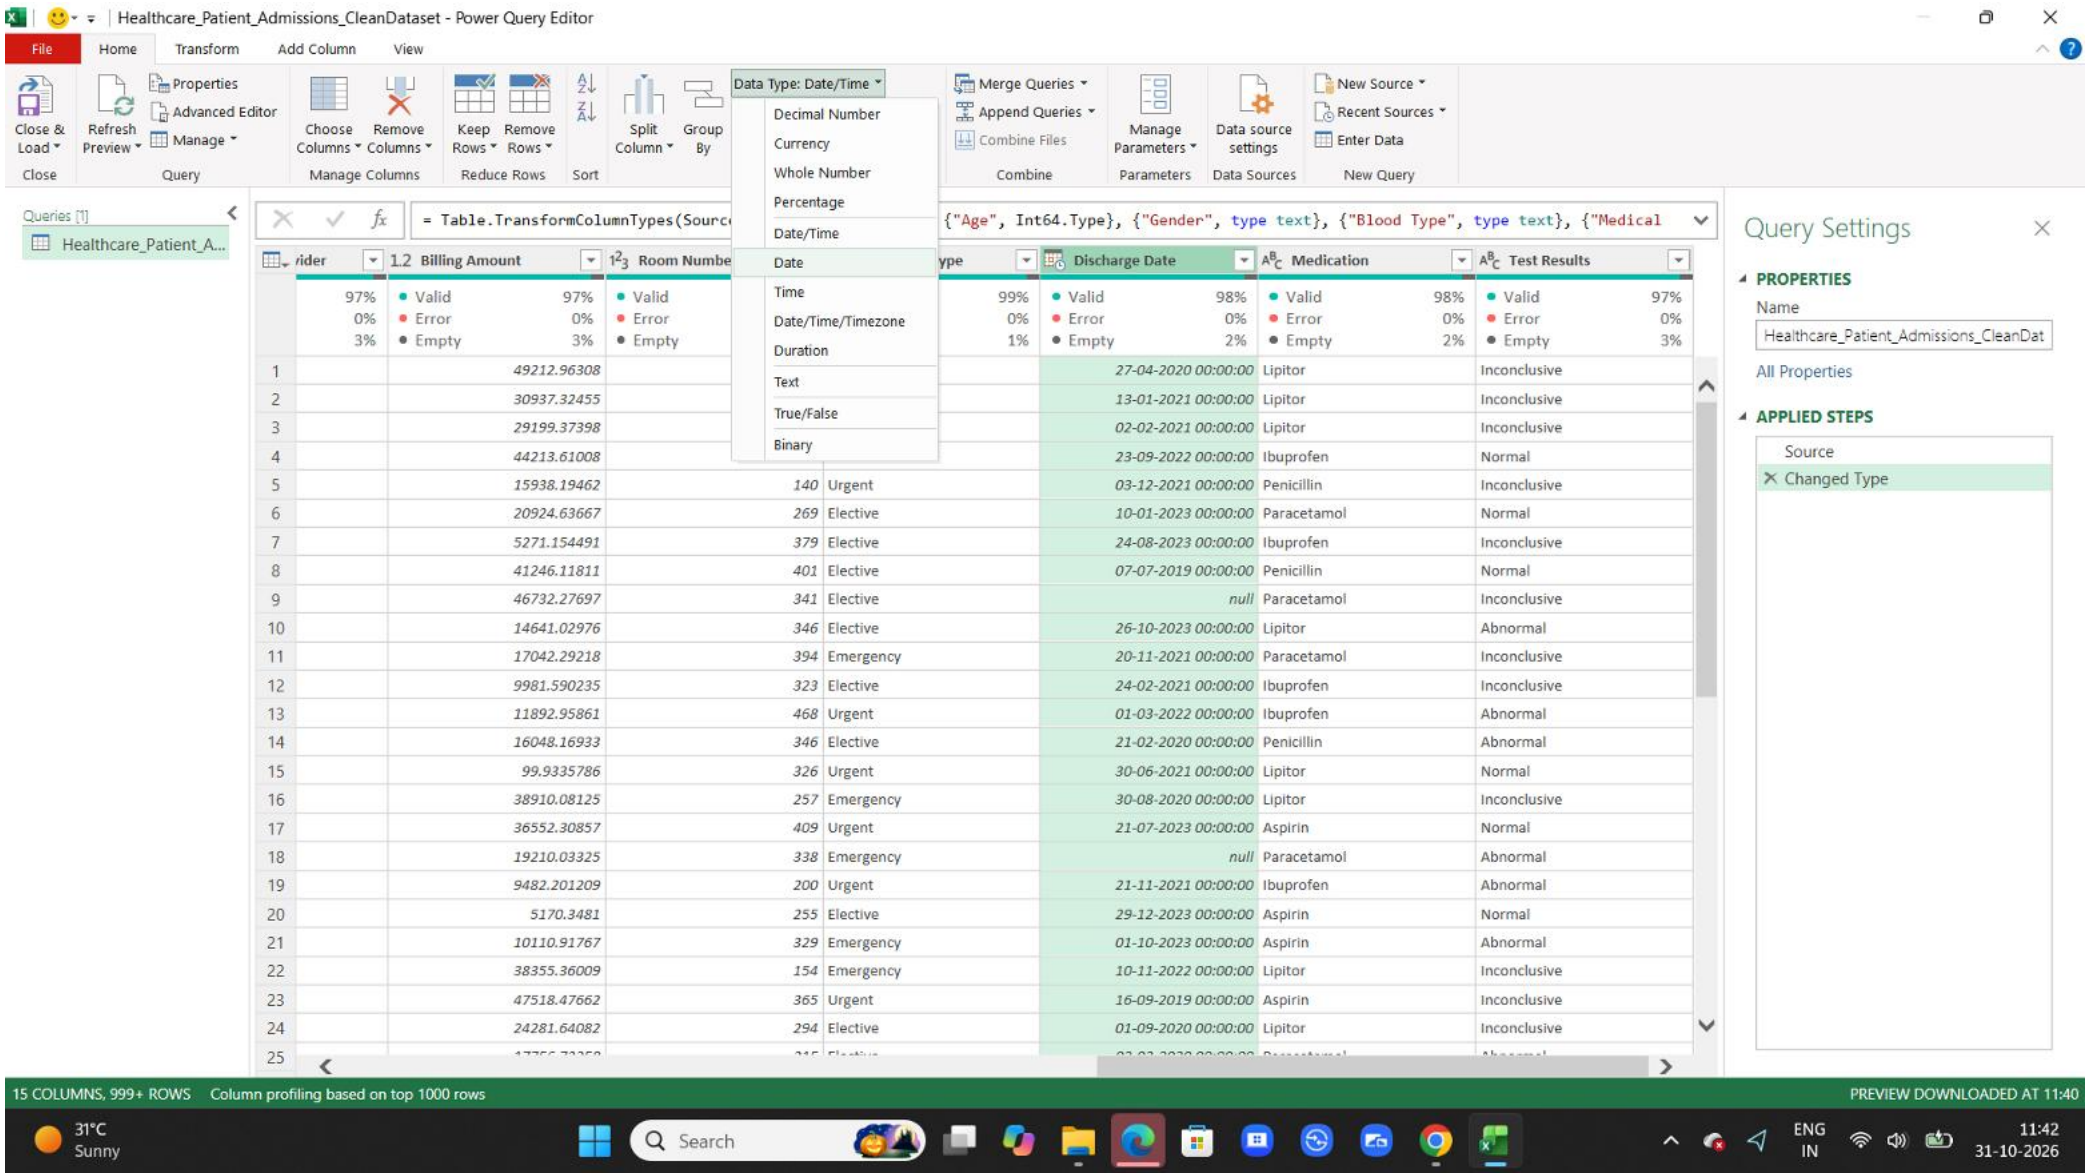

Observation: Checked the Date of Admission column after the type change. The values are displayed as dates only, without the 00:00:00 time portion, confirming the Date data type is applied.

Step 77 – Change Discharge Date data type to Date

Observation: Selected the Discharge Date column and opened the Data Type menu. Changed its data type from Date/Time to Date to keep only the discharge date and remove the time component.

Step 78 – Verify Discharge Date as Date

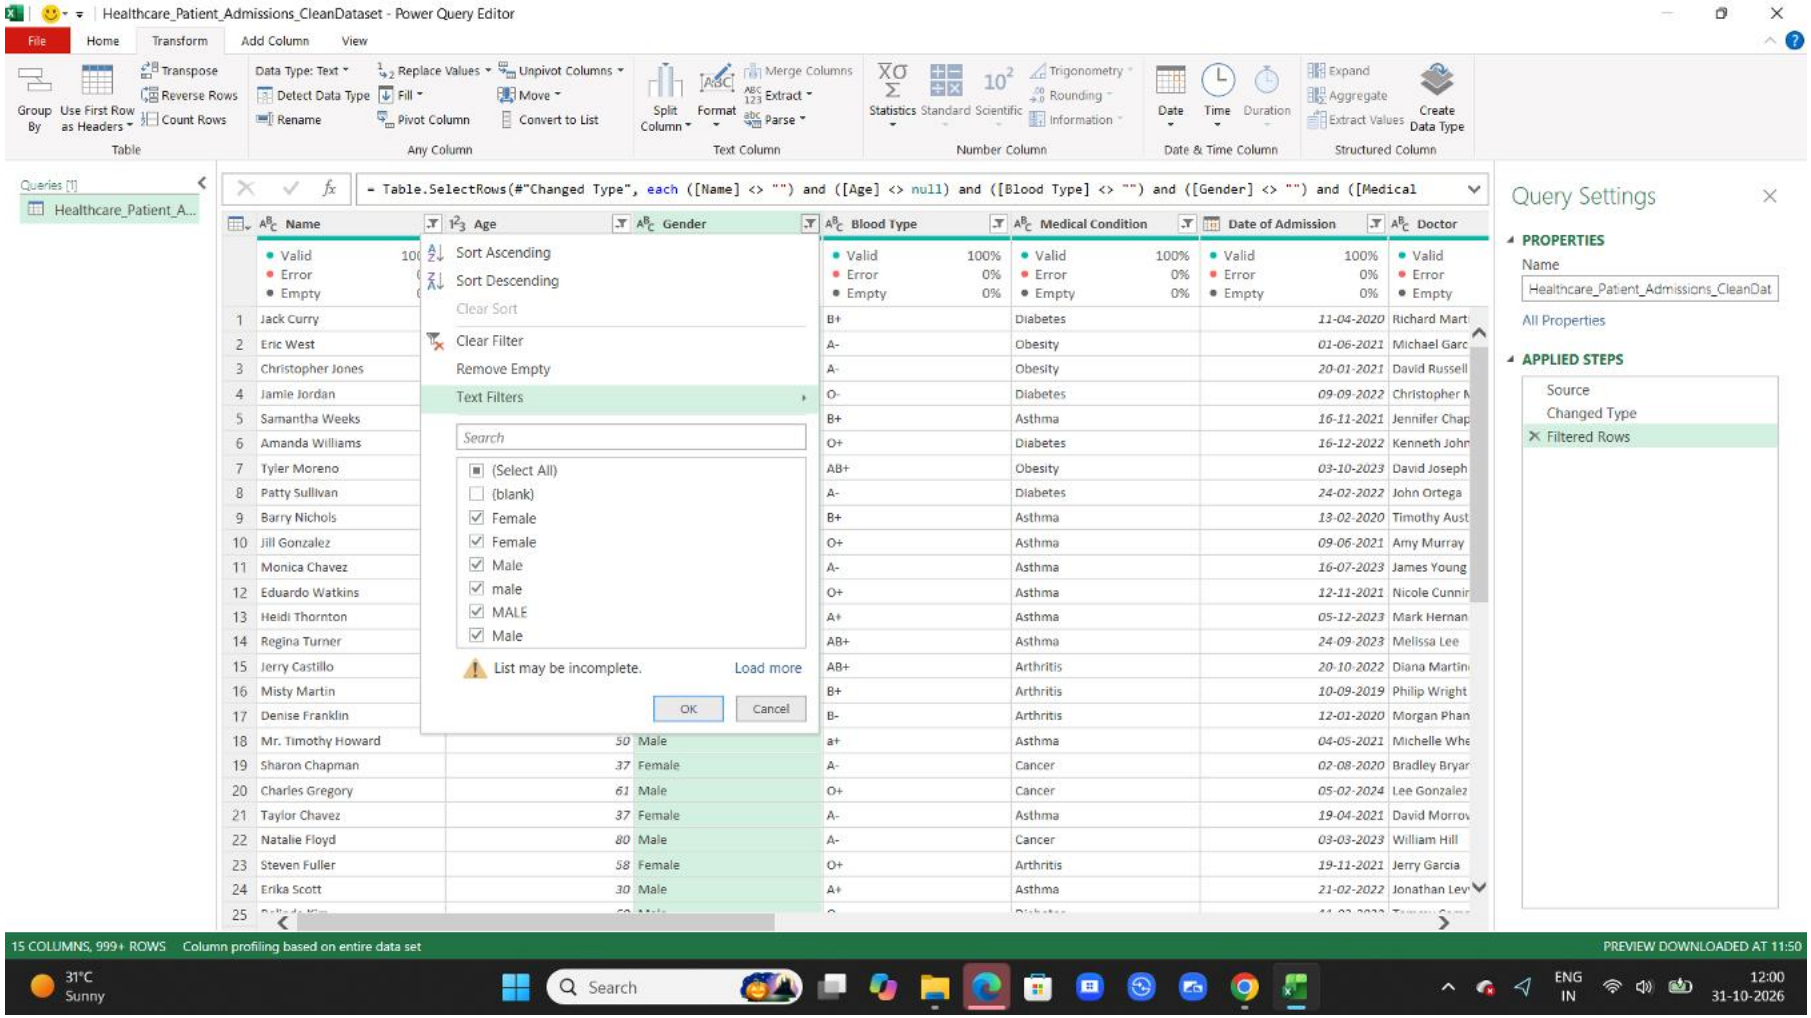

Observation: Reviewed the Discharge Date column after the type change. The values are displayed as dates only, without a time component, confirming the Date data type is applied.

Step 79 – Review the Gender column

Observation: Opened the Gender column filter and reviewed the available values. The list showed inconsistent capitalization, including “Female”, “female”, “Male”, “male” and “MALE”. This identified a text-formatting inconsistency that needed standardization.

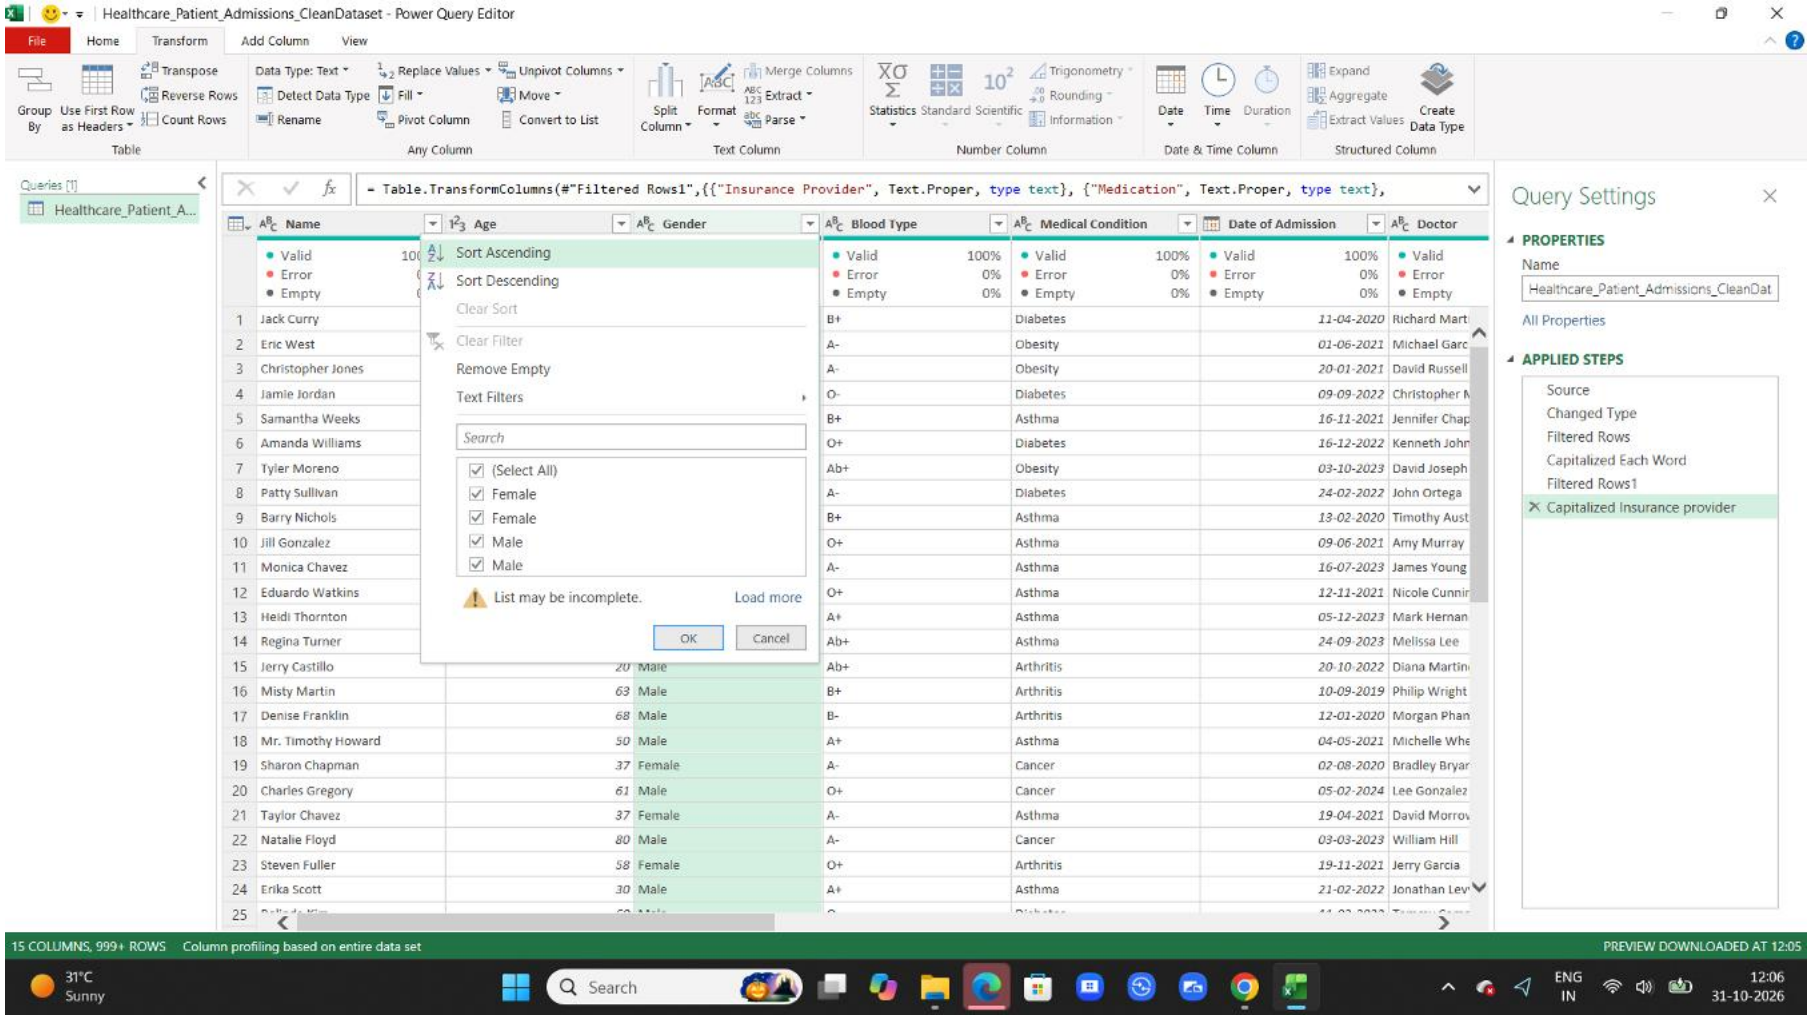

Step 80 – Open the text-formatting options

Observation: Opened Transform → Format for the Gender column. The menu provides text-cleaning and formatting options such as Trim, Clean, lowercase, UPPERCASE and Capitalize Each Word. These options can be used to standardize text values; the screenshot shows the formatting menu, not a separate confirmation that Clean was applied.

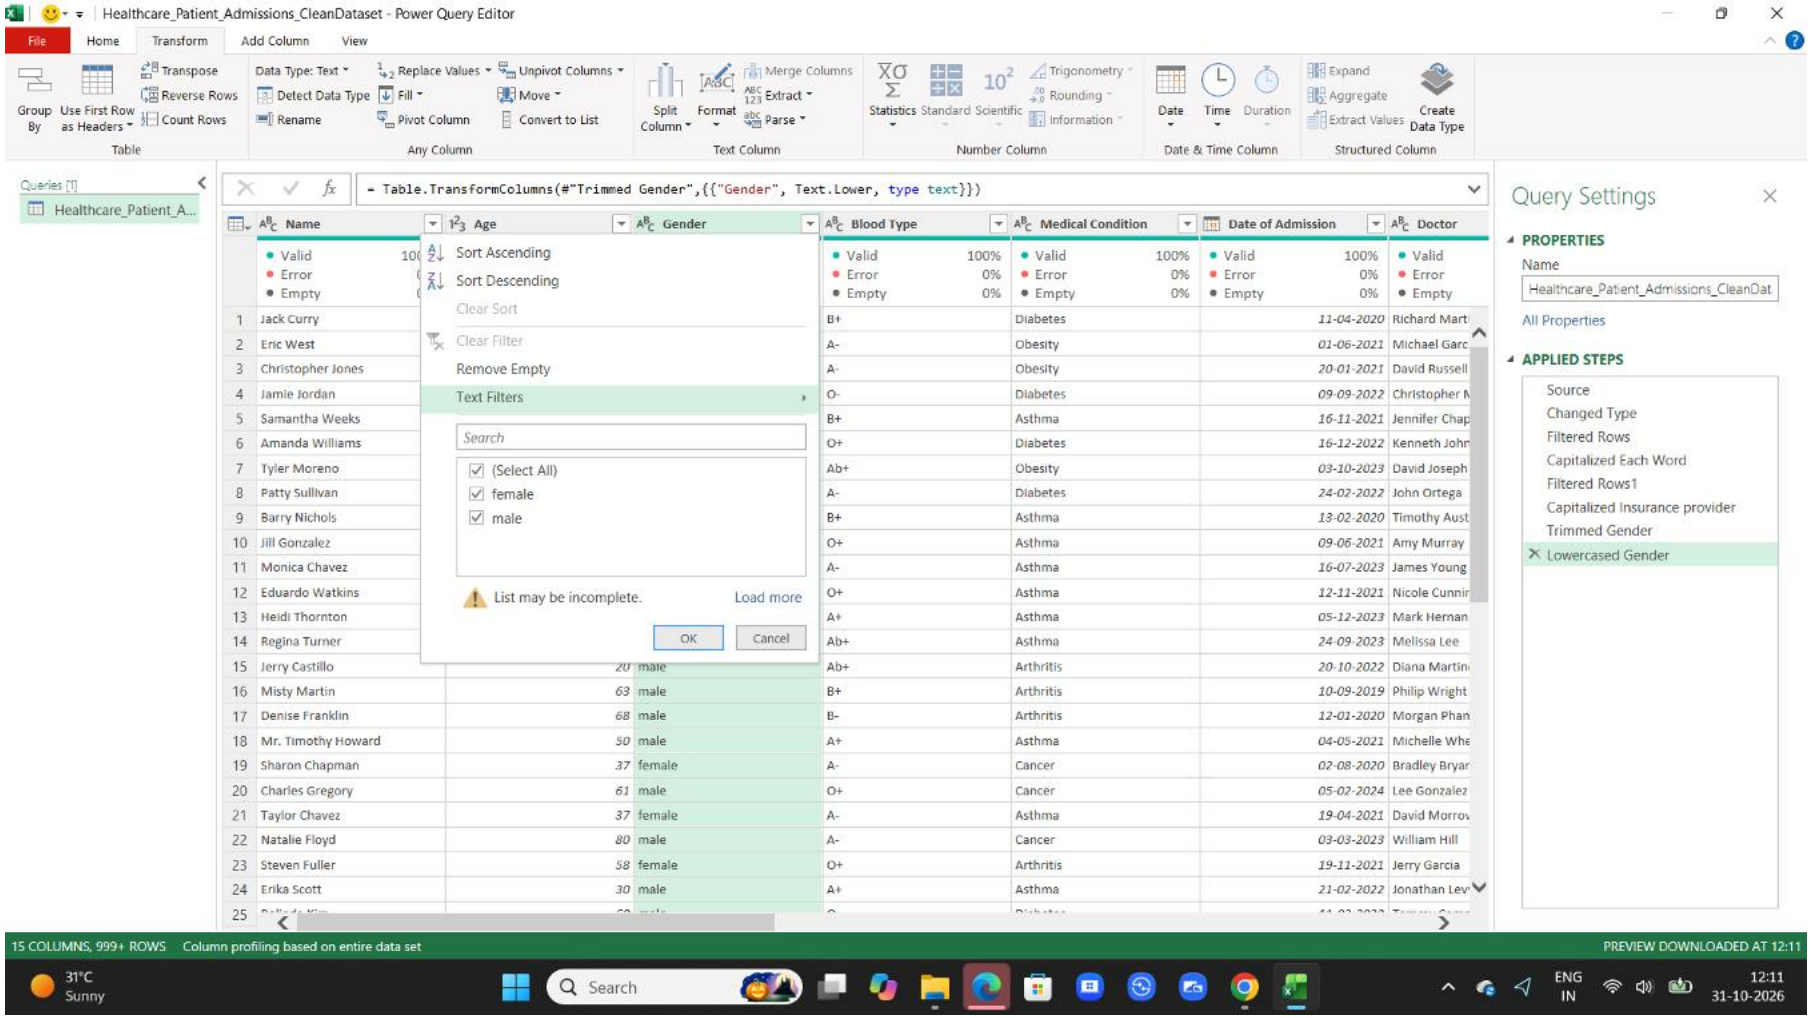

Step 81 – Review the formatted values

Observation: Reviewed the Gender filter values after the text-formatting work. The visible entries are displayed consistently as “Female” and “Male”. The Applied Steps pane also shows text-formatting steps in the query, including capitalization work on other columns.

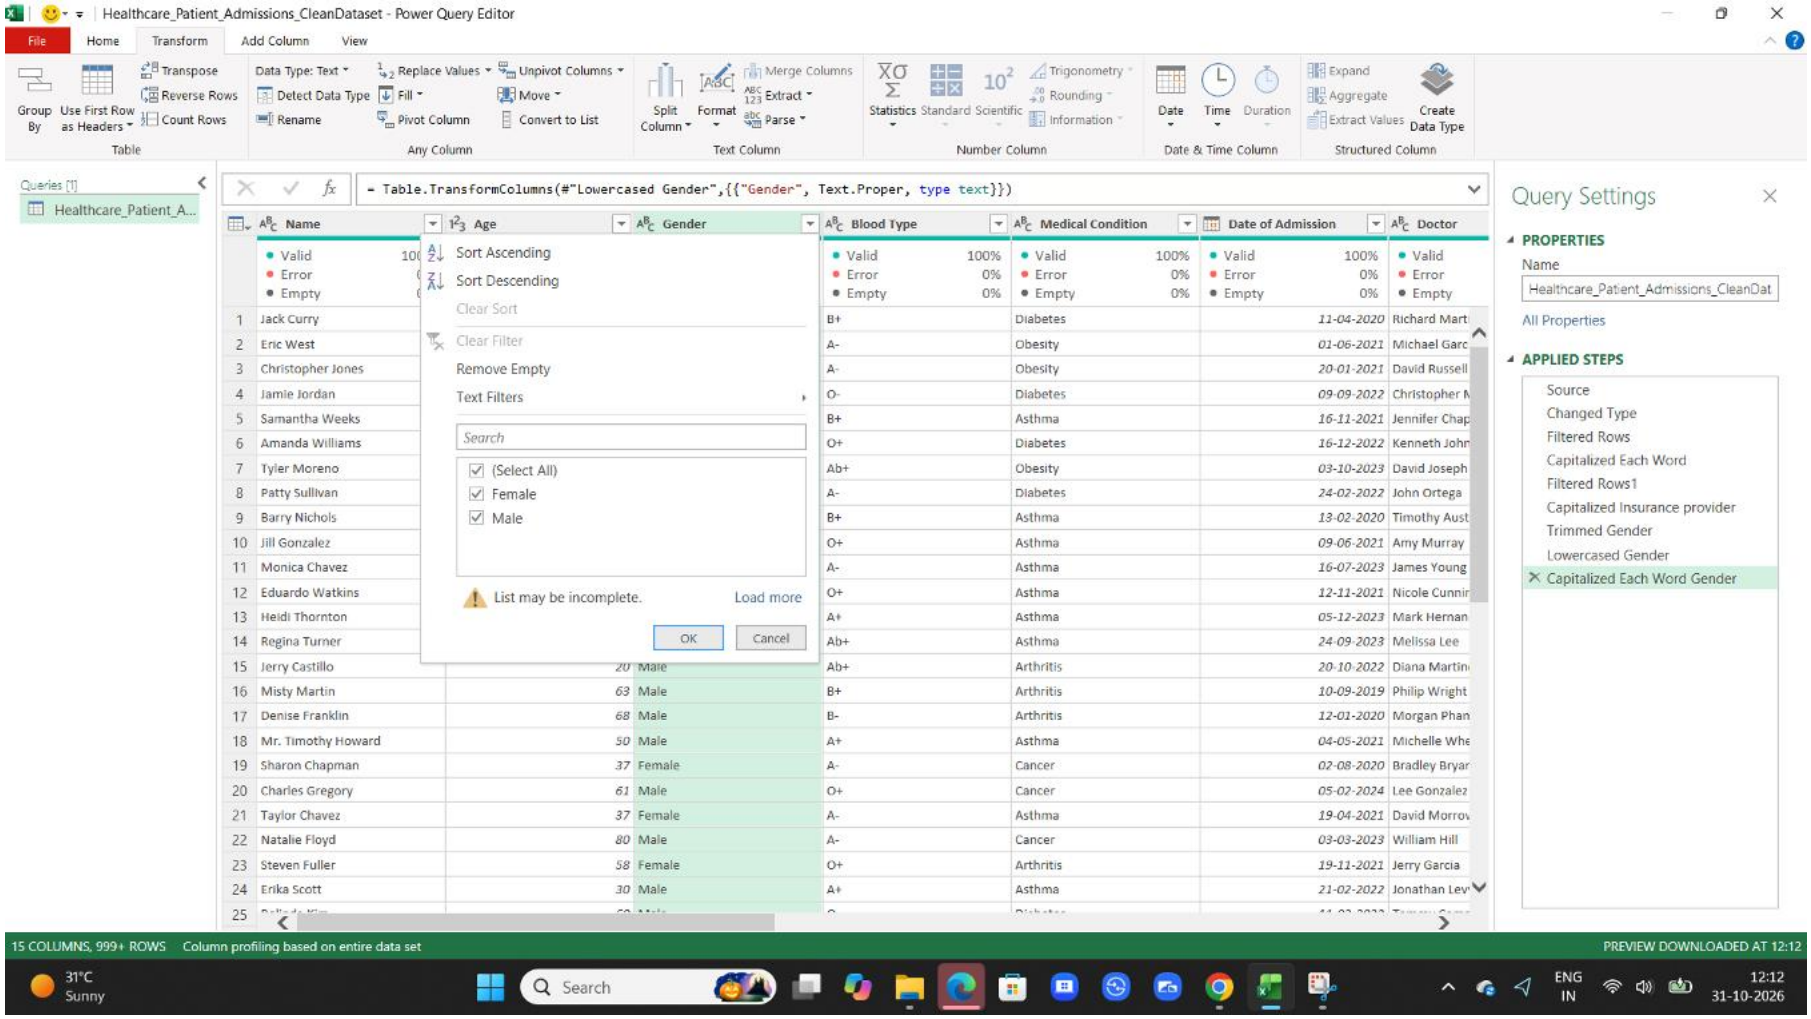

Step 82 – Trim spaces and convert Gender to lowercase

Observation: Applied the Trim operation to remove leading and trailing spaces from Gender, then converted the values to lowercase. The formula bar shows Text.Lower and the Applied Steps pane lists “Trimmed Gender” and “Lowercased Gender”. The filter now displays the two values “female” and “male”.

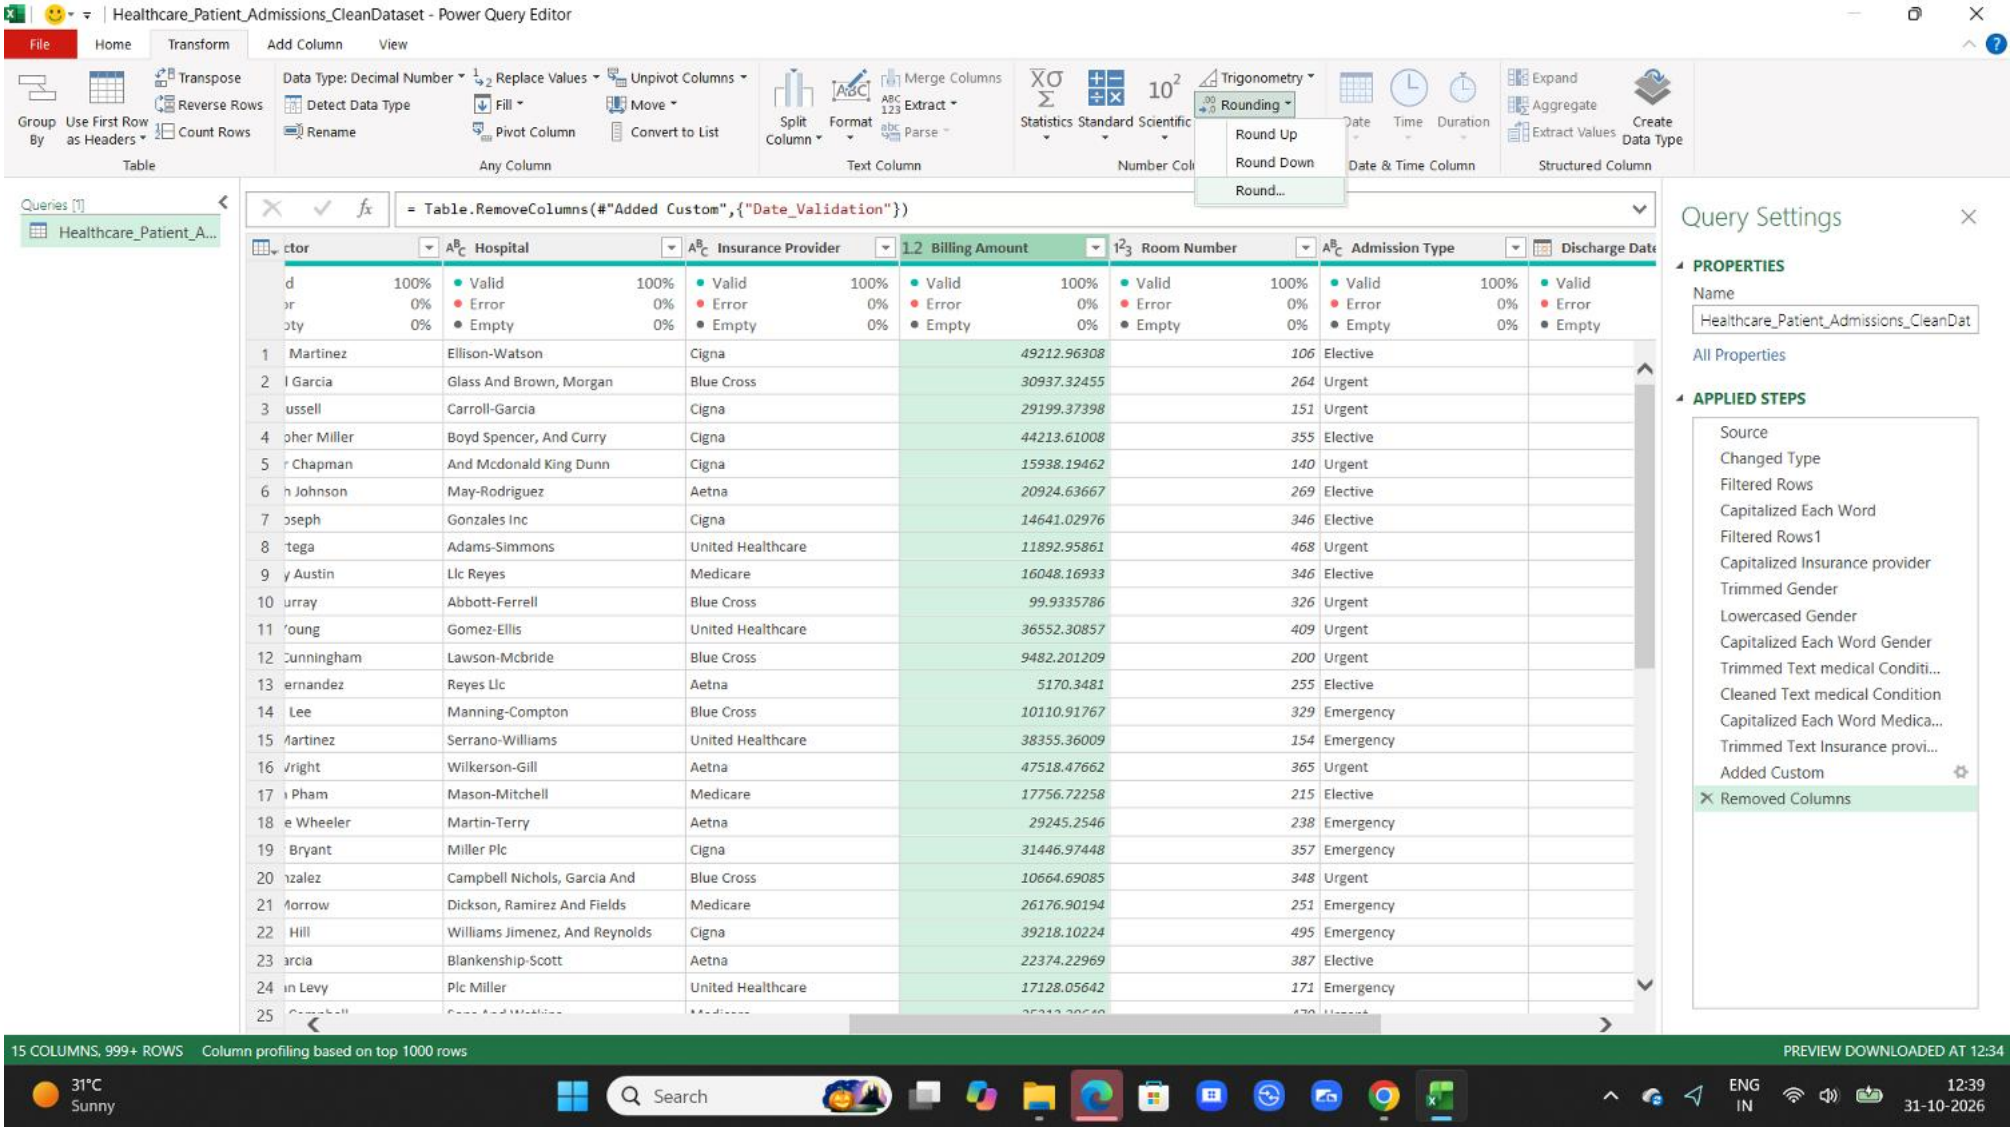

Step 83 – Capitalize each word in Gender

Observation: Applied Capitalize Each Word (Text.Proper) to the Gender column after trimming and lowercasing. The filter now displays the standardized values “Female” and “Male”, providing consistent capitalization for the Gender field.

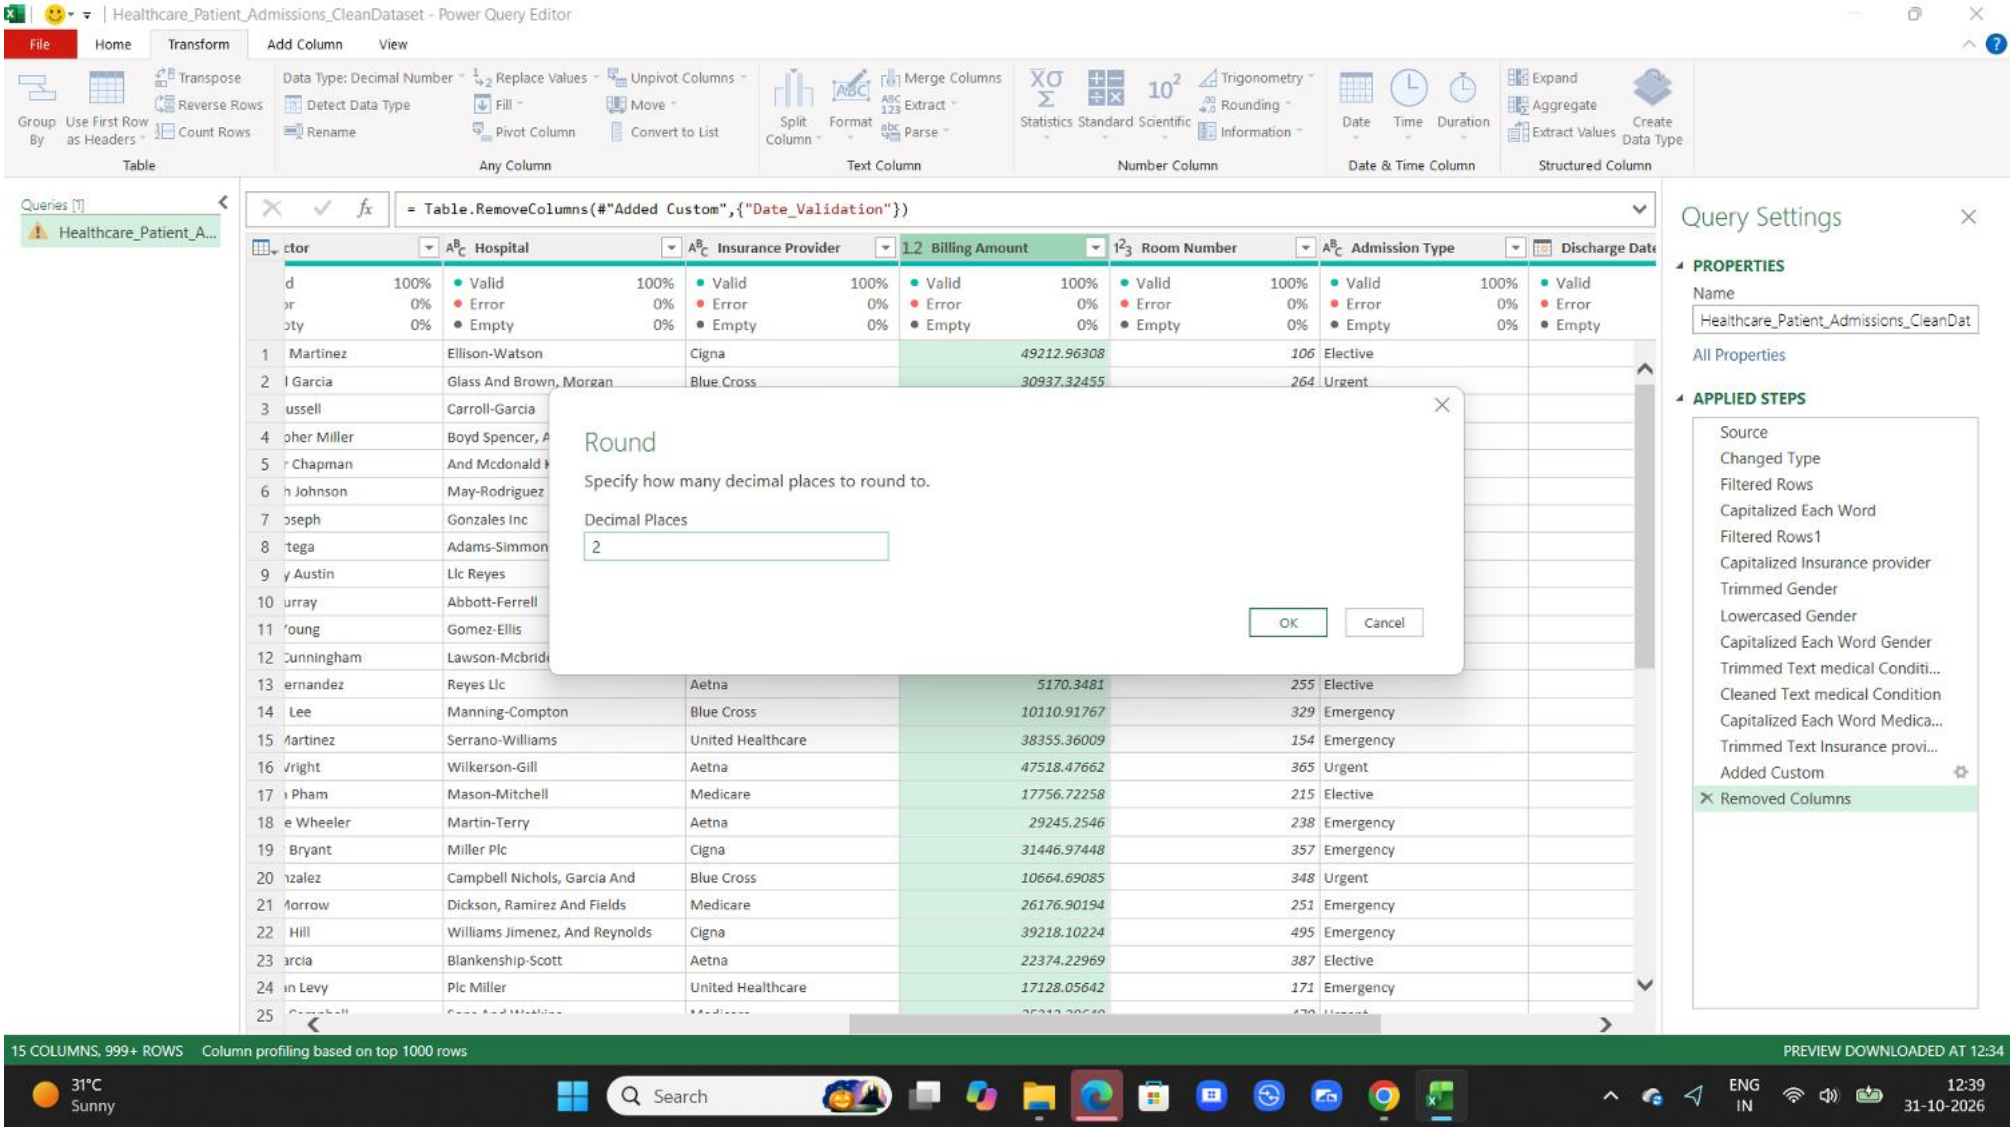

Step 84 – Open the Round Option for Billing Amount

Observation: Selected the Billing Amount column in Power Query and opened the Rounding menu. Chose the Round option to set the number of decimal places for the billing values.

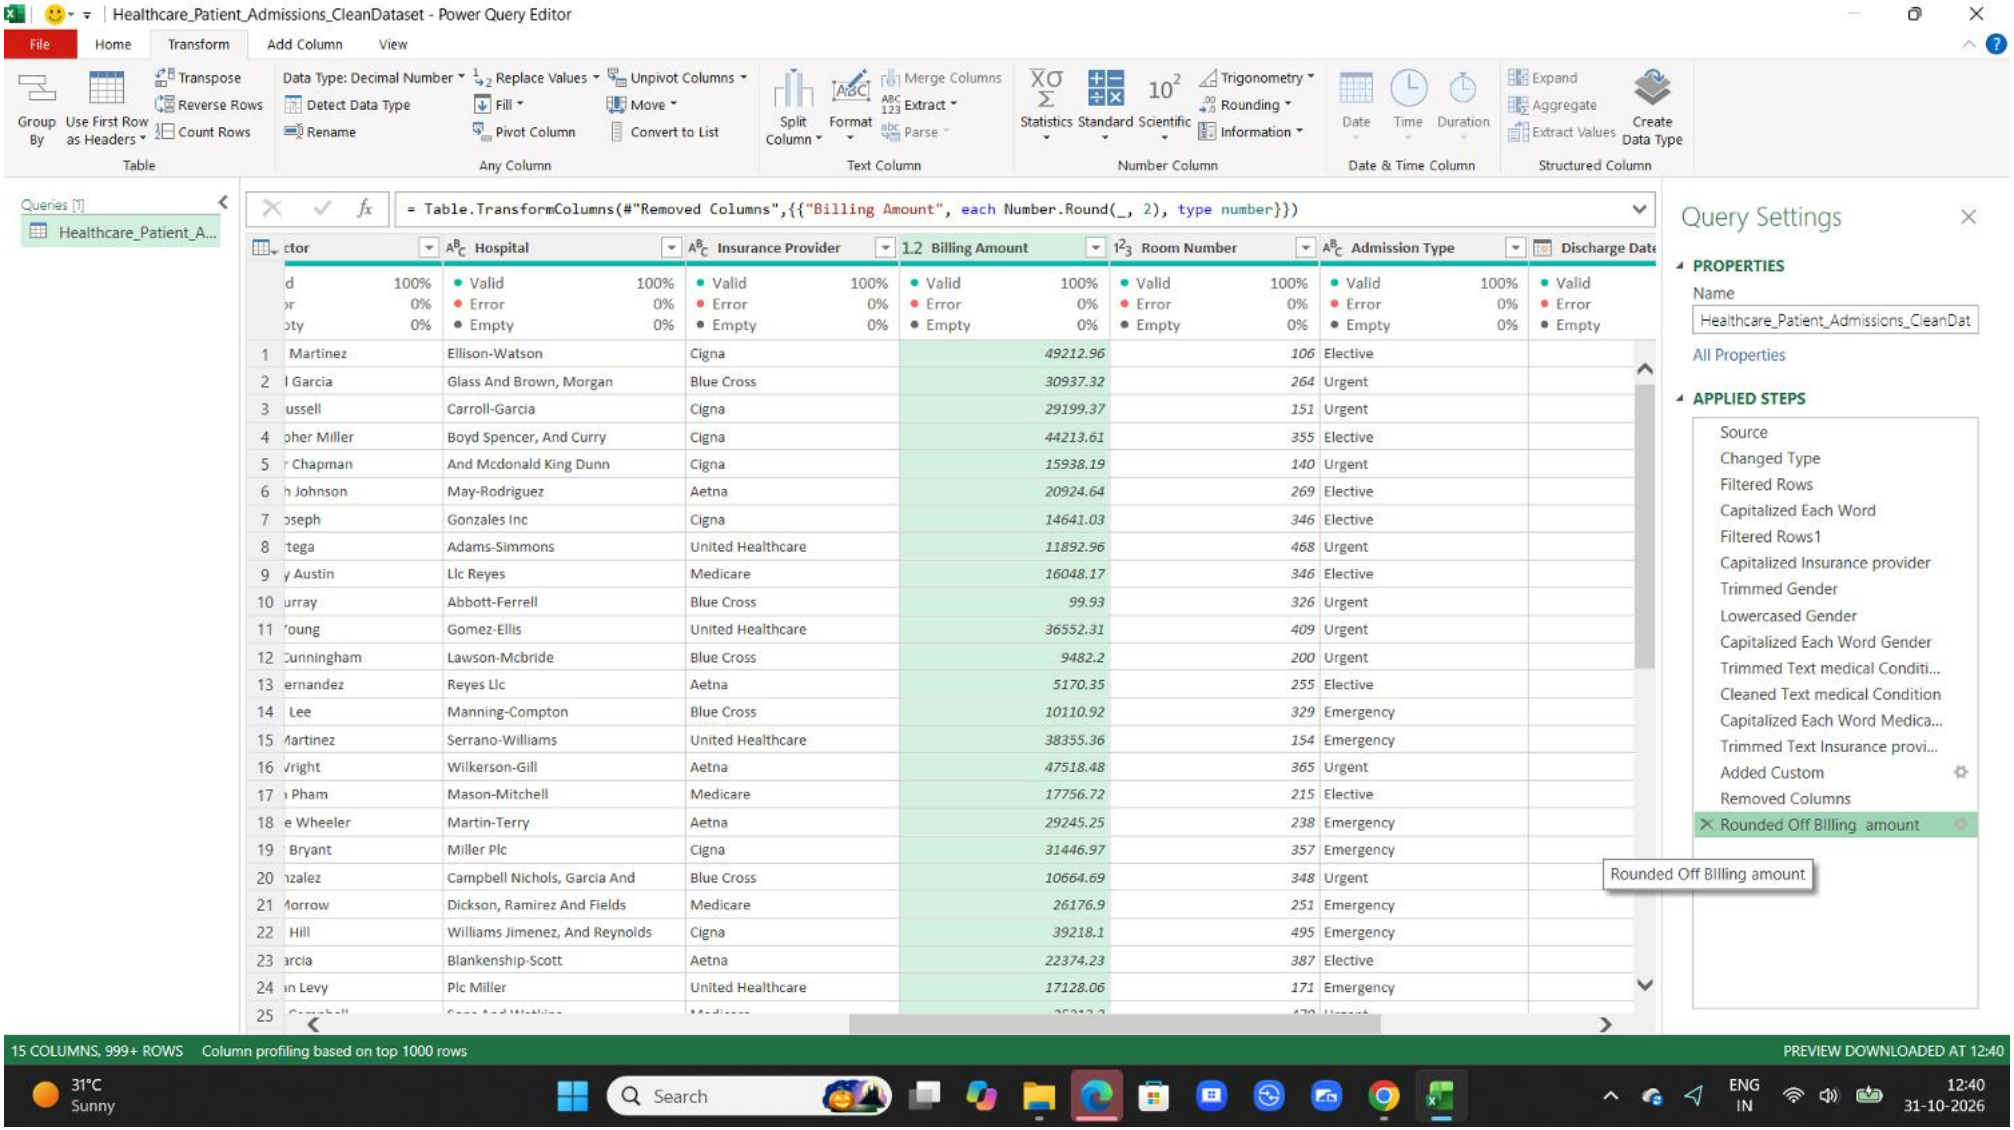

Step 85 – Set the Decimal Places to 2

Observation: In the Round dialog box, entered 2 in the Decimal Places field. This specifies that Billing Amount values should be rounded to two digits after the decimal point.

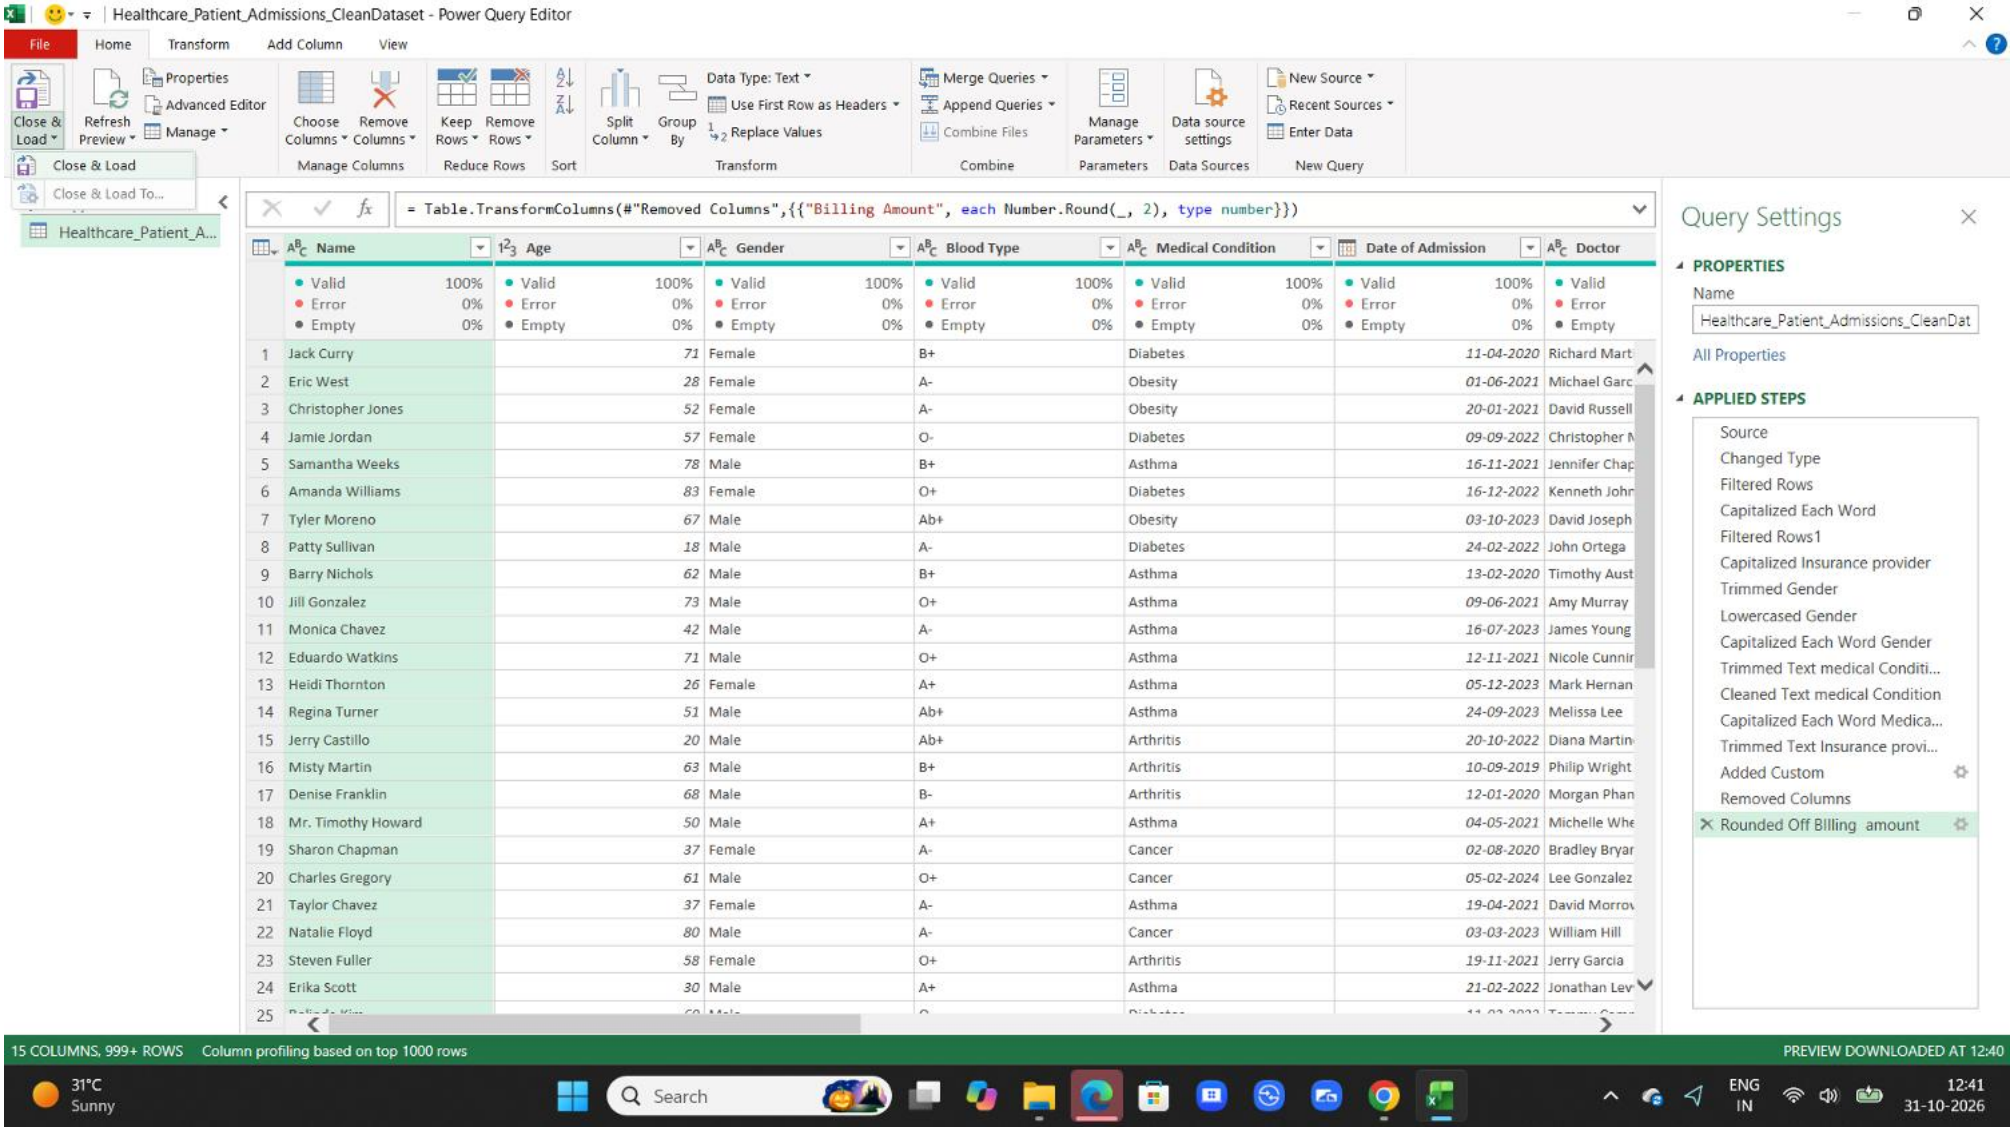

Step 86 – Apply Rounding to Billing Amount

Observation: Applied the rounding transformation to the Billing Amount column. The values are now displayed with two decimal places, making the billing figures consistent for reporting.

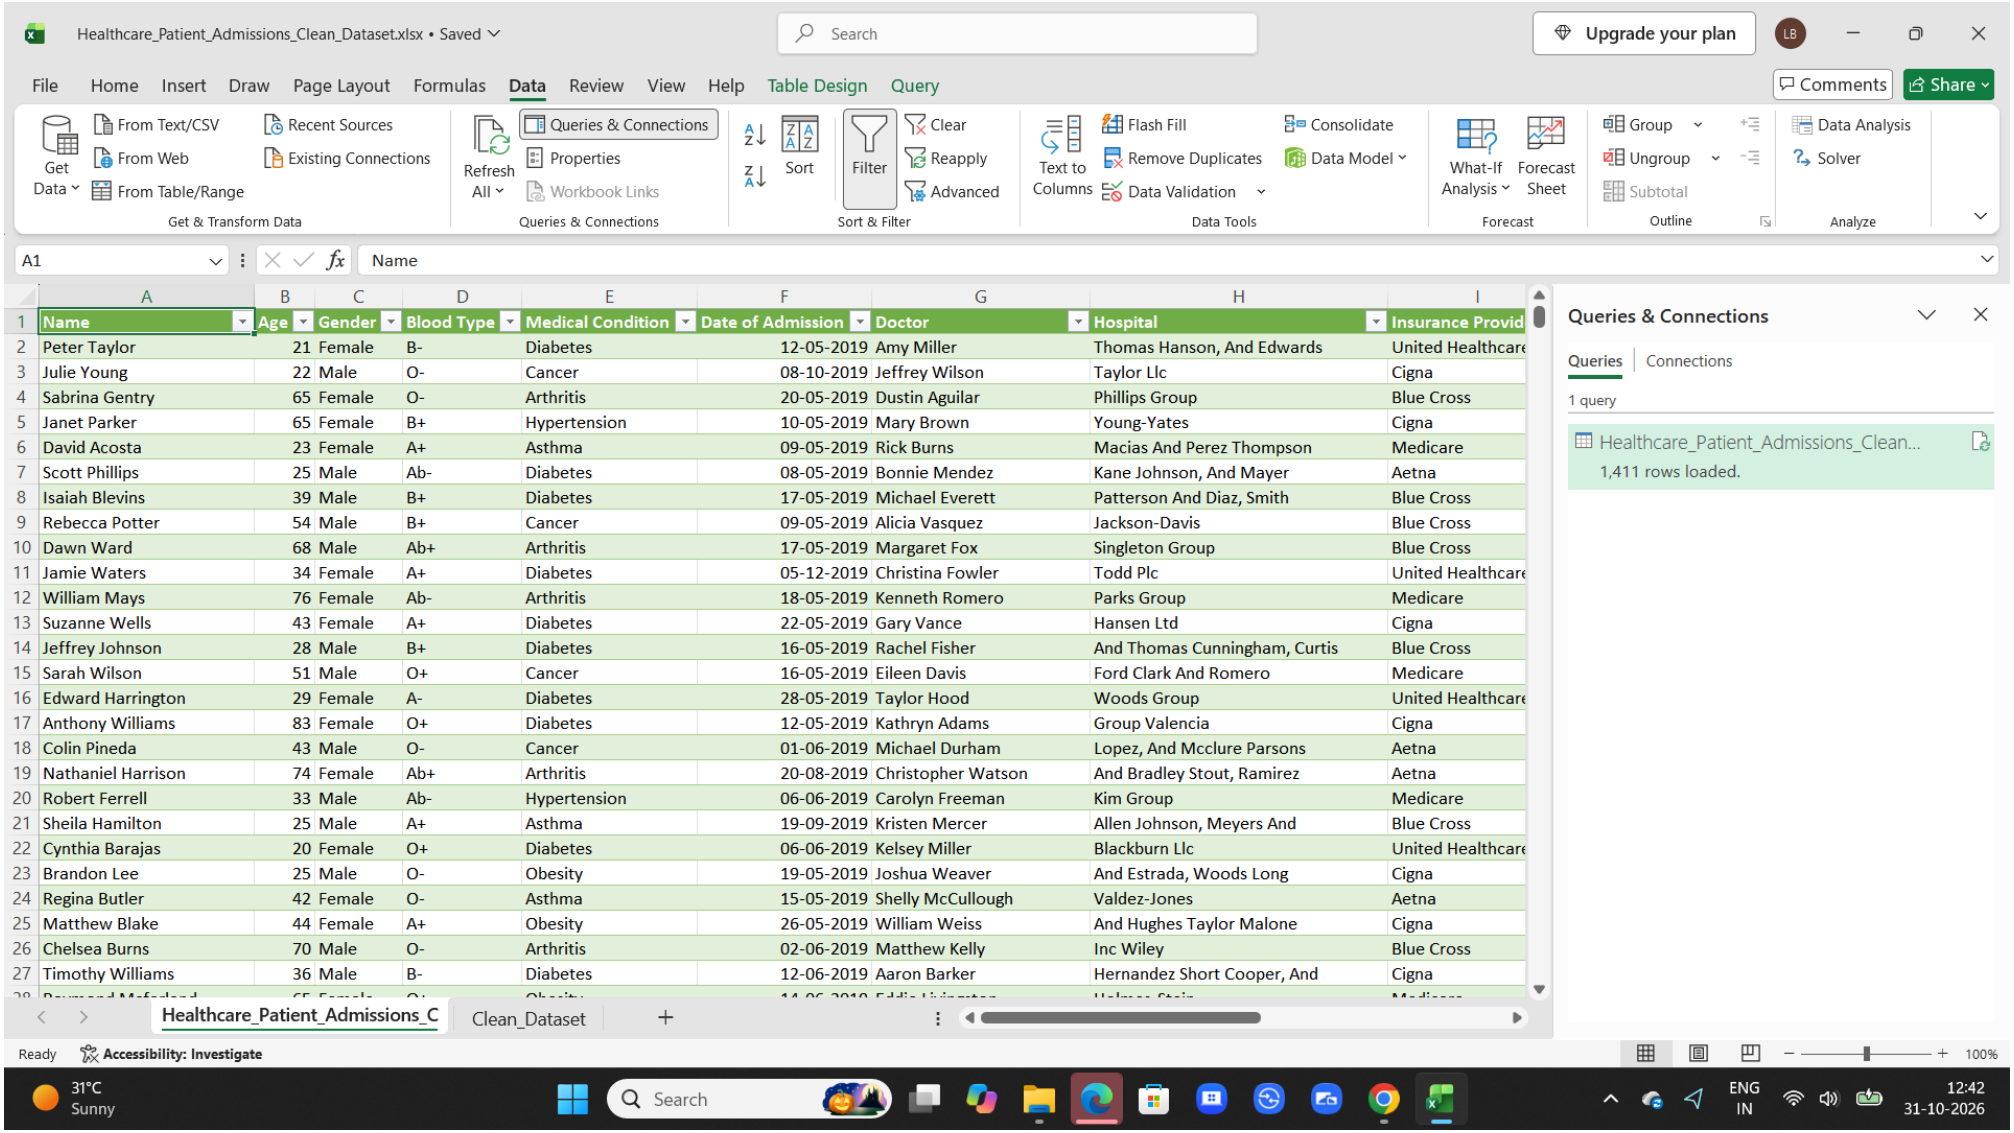

Step 87 – Review the Cleaned Data in Power Query

Observation: Reviewed the query after the rounding transformation. The preview shows the cleaned columns and the applied steps, with the column-quality indicators showing valid values and no empty values in the displayed columns.

Step 88 – Load the Cleaned Data into Excel

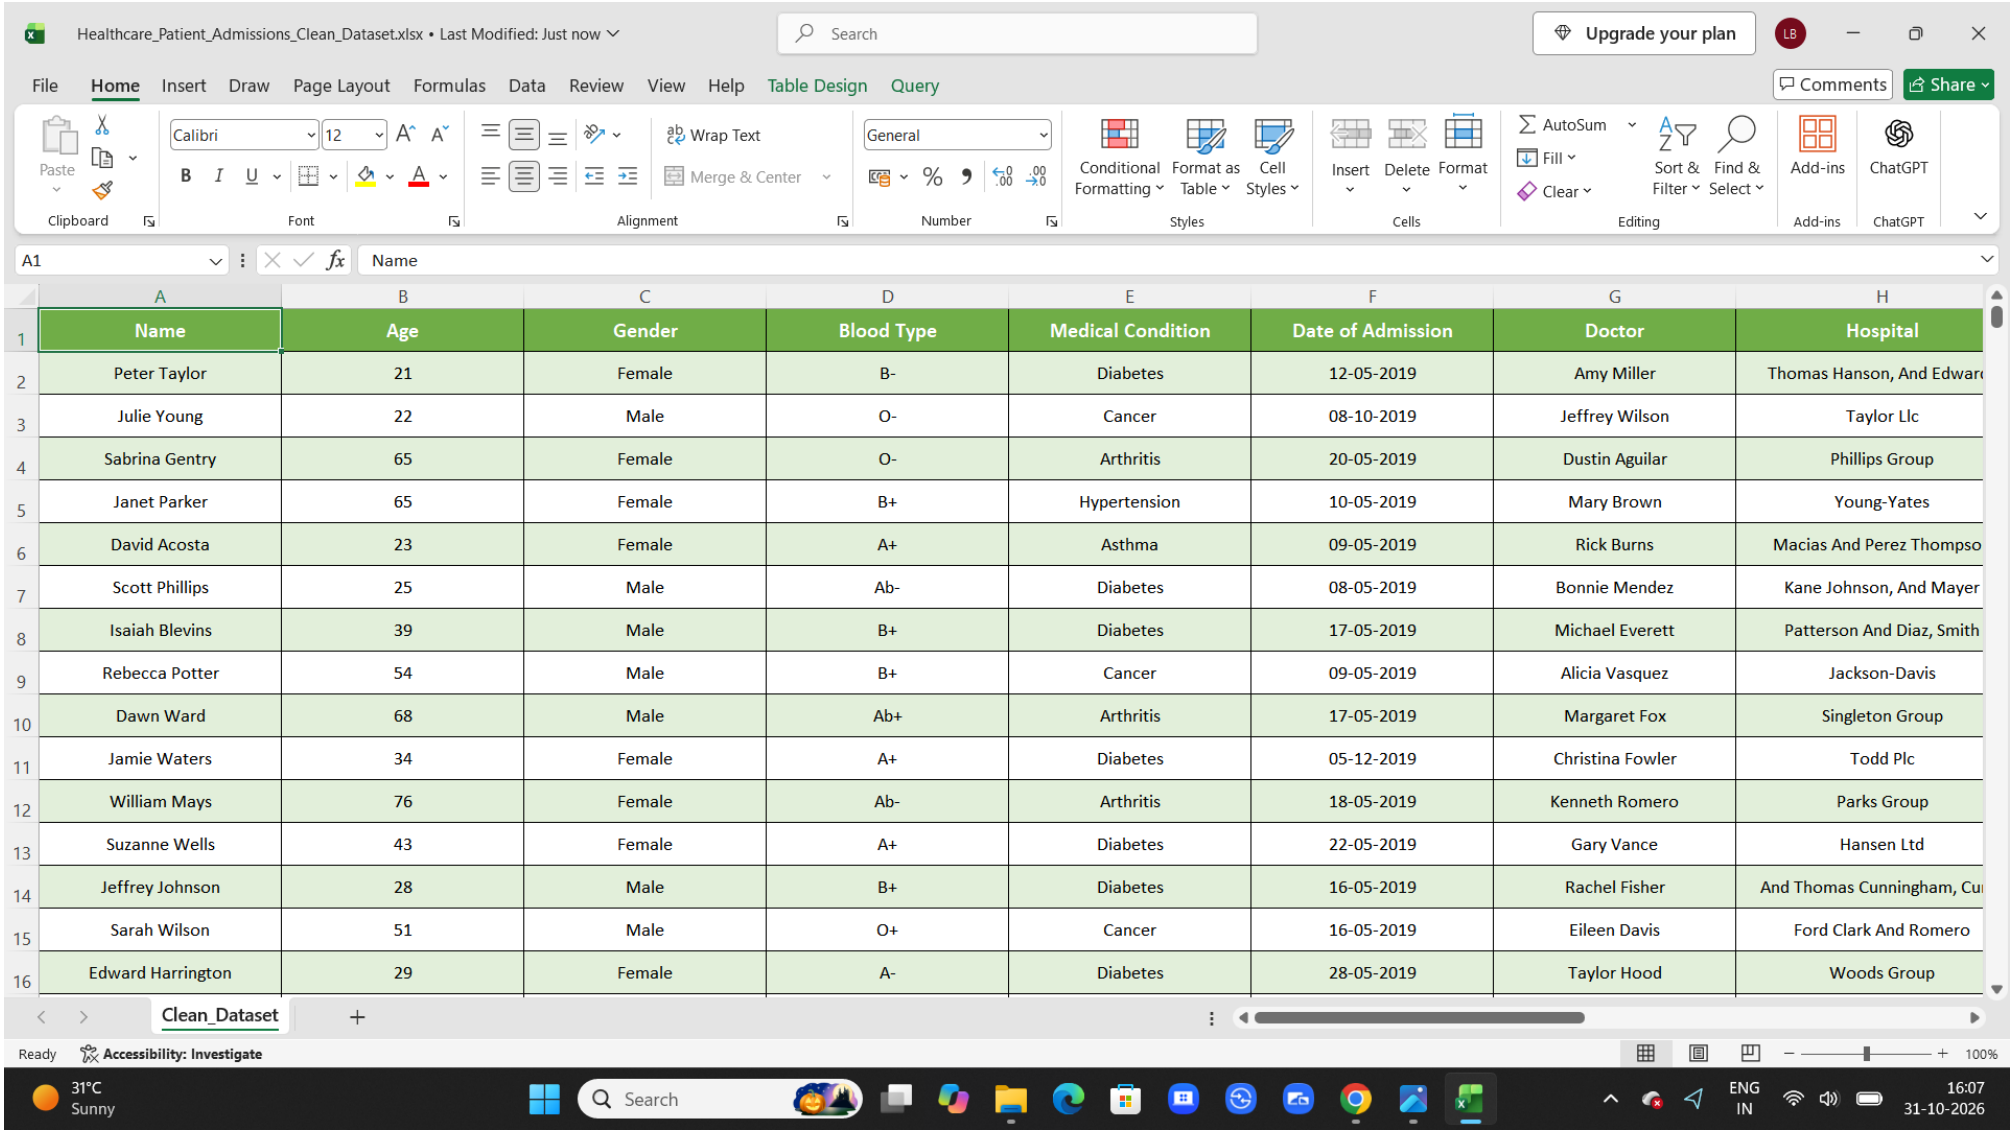

Observation: Used Close & Load to return the Power Query results to Excel. The Queries & Connections pane confirms that the cleaned query has been loaded, showing 1,411 rows loaded.

Step 90 – Create and Review the Patient_Dataset_New Table

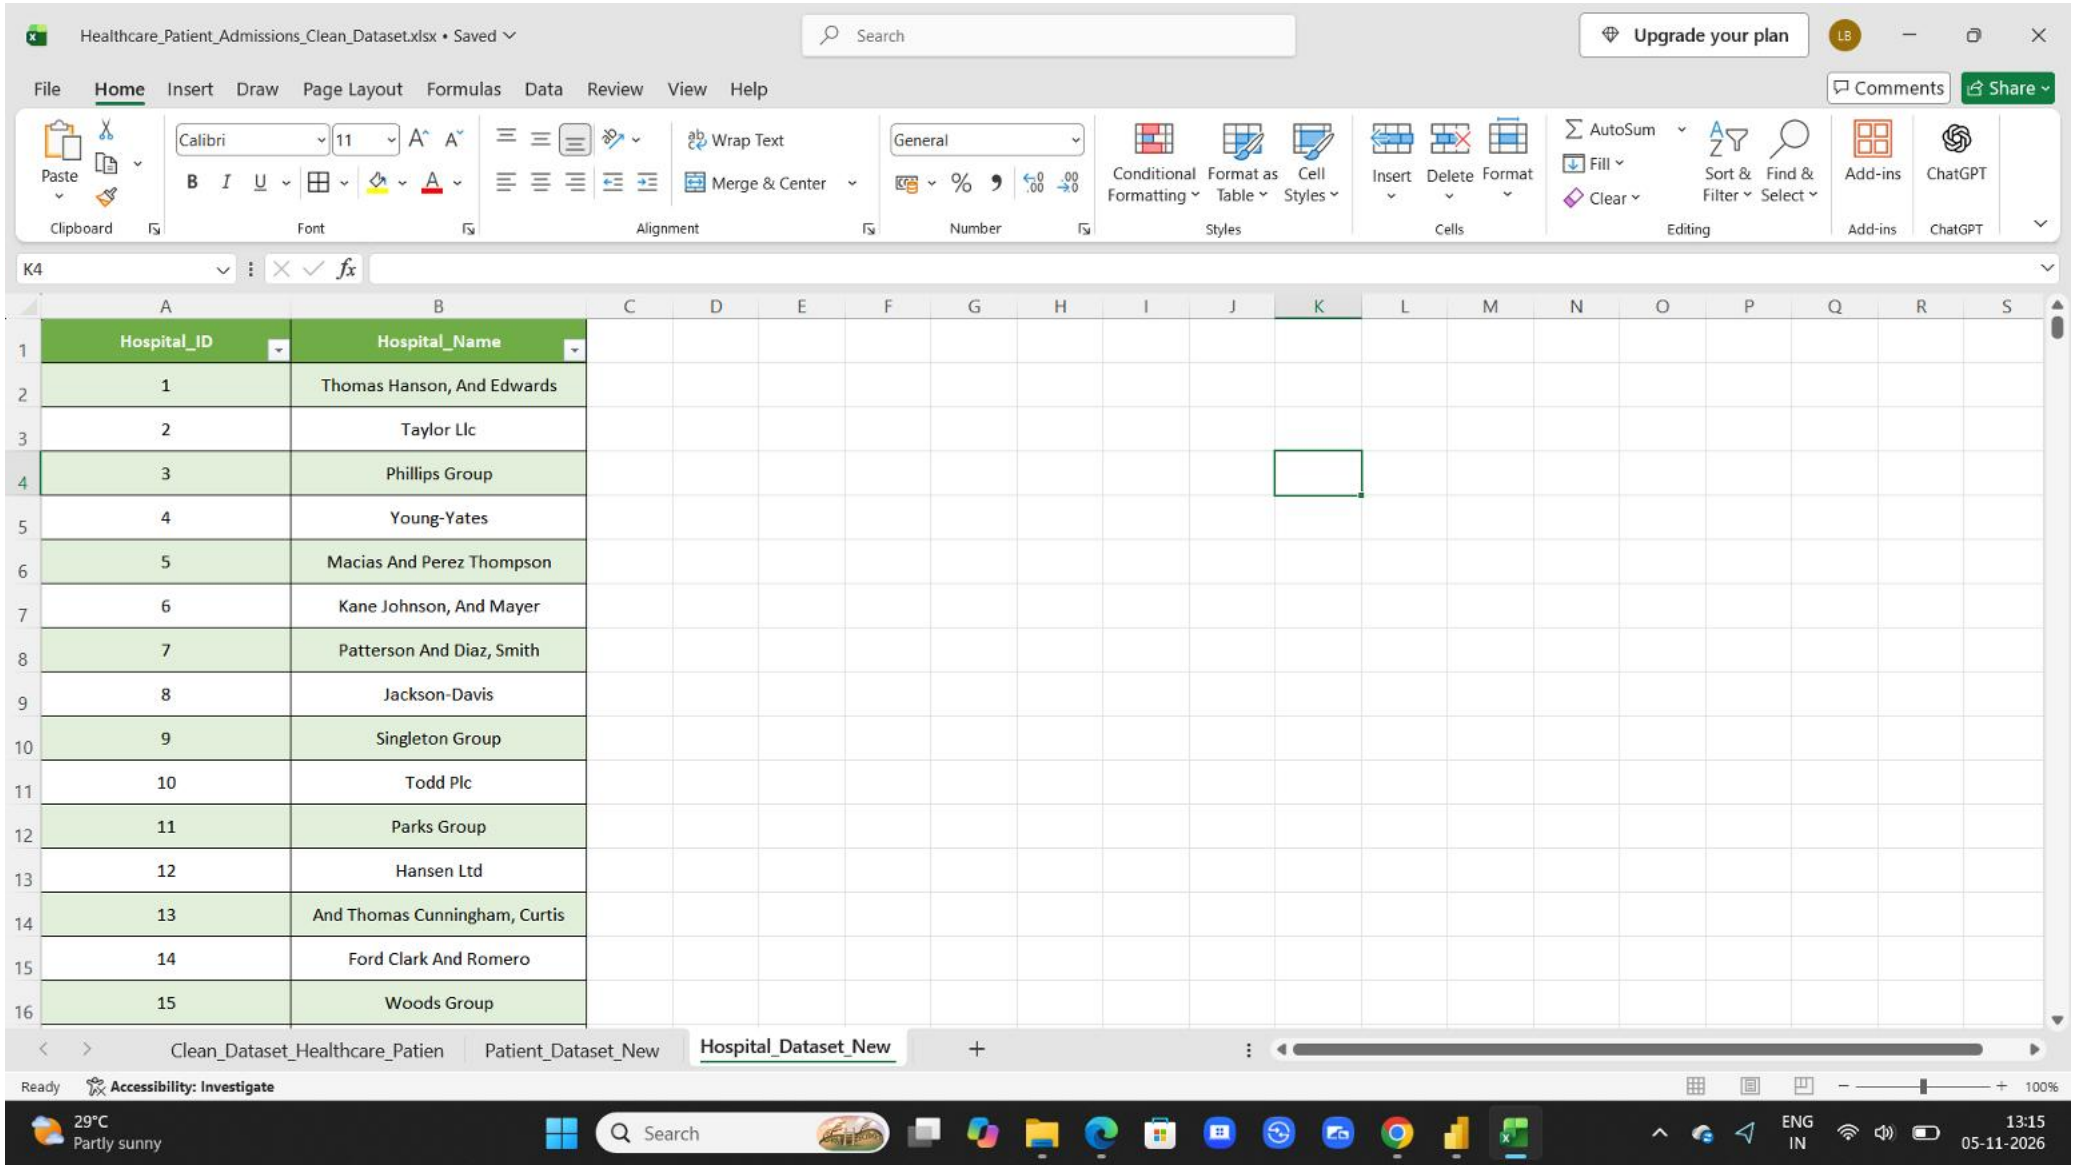

Observation: Created a separate patient dataset from the original healthcare admissions data and reviewed it in Excel. The table contains four fields: Admission_ID, Patient_Name, Age and Hospital_ID. The first column was renamed from “s” to “Admission_ID” so that it clearly identifies the admission record.

Admission_ID	Patient_Name	Age	Hospital_ID
1	Peter Taylor	21	1
2	Julie Young	22	2
3	Sabrina Gentry	65	3

Step 91 – Create and Review the Hospital_Dataset_New Table

Observation: Created a separate hospital dataset from the original healthcare admissions data. Removed duplicate hospital names and assigned a unique Hospital_ID using an index. The resulting table contains two fields: Hospital_ID and Hospital_Name, with one row for each unique hospital.

Excel and Power Query Data Cleaning – Updated Project Summary

Correct record summary

Dataset	Records	Explanation
Main Healthcare Dataset	1,411	Cleaned from 2,000 records; 589 records removed.
Patient_Dataset_New	1,411	Current patient table.
Hospital_Dataset_New	1,385	Unique hospital names after removing duplicates.

Updated totals

Metric	Updated count	Explanation
Total records across all three tables	4,207	1,411 + 1,411 + 1,385.
Records removed from the main dataset	589	2,000 original records – 1,411 cleaned records.
Hospital records removed as duplicates	26	1,411 – 1,385.

Dataset Overview

1. Main Healthcare Dataset

The main healthcare admissions dataset is the primary cleaned dataset. The original raw dataset contained 2,000 records. After the cleaning process, 1,411 records remained, meaning 589 records were removed. The dataset contains 15 columns covering patient details, admission dates, hospital, insurance, billing and medical information.

2. Patient_Dataset_New

A separate patient table was created from the cleaned healthcare dataset. It contains four columns: Admission_ID, Patient_Name, Age and Hospital_ID. The current patient table contains 1,411 records.

3. Hospital_Dataset_New

A separate hospital table was created from the healthcare data. Duplicate hospital names were removed, and Hospital_ID was assigned using an index. The table contains two columns: Hospital_ID and Hospital_Name. After duplicate removal, 1,385 records remain.

Final project record counts

Dataset	Final records
Main Healthcare Dataset	1,411
Patient_Dataset_New	1,411
Hospital_Dataset_New	1,385
Total across all three tables	4,207
